

Haul Roads Full Potential

Newmont Mining Corporation's Full Potential Program is all about continuous improvement – diagnosing, designing, and delivering initiatives that improve key production and support functions. These projects focus on productivity and reduction in unit costs, which enhance our operational excellence and deliver improved levels of operating cash flow. In its mining operations around the world, Newmont employees are pursuing specific projects that are part of the Full Potential Program.

Here at Newmont CC&V, we have many of these projects underway – haul roads are one:

Haul roads are being reconstructed to improve safety and visibility, and graded to more consistent slopes for hauling efficiency. In addition, this investment will reduce maintenance requirements and provide better drainage for improved storm water management and environmental controls. This work began in the summer of 2016 with detailed surveys of the road network and traffic studies. The work has progressed, with priority given to changes that improve safety, and is nearing completion with roads that have been redesigned to improved standards of efficiency.

Of course, many individuals and departments at CC&V were involved in the project, with support coming from mine management, engineering, and the safety department. This team work is captured by this comment from Cody Reisch, Project Supervisor: “It was terrific to see everyone working safely together on a project that has received overwhelmingly positive feedback from mine operations and process personnel.”
