Re: NEXT PHASE OF THE PSE&G GAS SYSTEM MODERNIZATION PROGRAM MONTHLY REPORT – FEBRUARY 2023

Dear Acting Secretary Diaz:

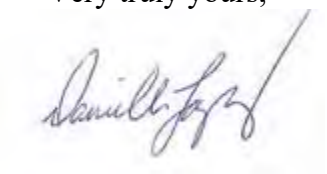
Enclosed for filing is the letter and enclosures providing Public Service Electric & Gas Company's (PSE&G's) monthly report for February 2023 on its Next Phase of the Gas System Modernization Program (GSMP II or the Program).

The GSMP II was approved by a Board Order dated May 22, 2018 in BPU Docket No. GR17070776. That Order adopted a Stipulation pursuant to which PSE&G is operating the Program. This report is filed pursuant to paragraph 43 of that Stipulation and is designed to address the first four items contained in Attachment C to that Stipulation.

The first three items are addressed in the attached materials. With regard to item 4, there were no funds or credits received from the United States government, the State of New Jersey, a county or a municipality, for work related to any of the Program projects.

Consistent with the Order issued by the Board in connection with In the Matter of the New Jersey Board of Public Utilities' Response to the COVID-19 Pandemic for a Temporary Waiver of Requirements for Certain Non-Essential Obligations, BPU Docket No. EO20030254, Order dated March 19, 2020, this document is being filed electronically with the Secretary of the Board and the Division of Rate Counsel. No paper copies will follow.

Very truly yours,



Danielle Lopez

I. Executive Summary

Public Service Electric & Gas's (PSE&G's) Infrastructure Advancement Program (IAP, or "Program") was established from a Stipulation that the involved parties agreed to in June 2022, as approved by a New Jersey Board of Public Utilities (BPU) Order dated June 29, 2022, with an effective date of July 1, 2022. The Stipulation provided the approved investments to be made by PSE&G on its electric and gas distribution systems, including those subject to an accelerated rate recovery mechanism (IAP Rate Mechanism) and those that are not recoverable through Infrastructure Investment Program (IIP) regulations or the IAP Rate Mechanism, but instead executed as Stipulated Base projects. In total, the Stipulation approved $351.0 million in investments to be made under the IAP Rate Mechanism and $160.0 million in investments within Stipulated Base with the work to be performed from July 1, 2022 until June 30, 2026.

As part of the Stipulation, PSE&G was required to retain an independent monitor (IM) *"to review and report to Board Staff and Rate Counsel on the impact of the IAP on overall system performance during severe weather events; cost effectiveness and efficiency; appropriate cost assignment; and other information deemed appropriate by the Company, Board Staff and Rate Counsel."* Pegasus-Global Holdings, Inc. (Pegasus-Global) was engaged to serve as the IM for the IAP and held an introductory meeting with PSE&G on January 17, 2023 ahead of a formal kickoff meeting on April 19, 2023. In the period between the introductory meeting and the formal kickoff meeting, the initial IAP documentation was requested by the IM and provided by PSE&G. Similar to the Energy Strong 2 Program, PSE&G and the IM have also commenced meeting on a bi-weekly basis to review the status of the IAP. This initial IM report discusses the status of the Program from its commencement on July 1, 2022 through December 31, 2022.

A summary of the approved IAP investments is provided in **Table 1 – IAP Overall Cost Summary as of December 31, 2022**, which shows the original Stipulation budget, actual costs to date, and PSE&G's current forecast.

Table 1 – IAP Overall Cost Summary as of December 31, 2022

Subprogram	Q3 2022 Spend	Q4 2022 Spend	Total Actual Costs to Date	Total Forecast	Stipulation Budget	% of Actuals to Budget	Forecasted Final In-Service
IAP Rate Mechanism							
Electric Outside Plant							
Spacer Cable Conversion	$0	$0	$0	$42,000,000	$42,000,000	0%	Jun 2026
Lashed Cable Replacement	$1,394	$1,290,876	$1,292,270	$14,000,000	$14,000,000	9%	Jun 2026
Spacer Hardware Upgrade	$555	$5,222,157	$5,222,712	$15,000,000	$15,000,000	35%	Jun 2024

Stipulated Base Total	***$193,432***	***$10,128,252***	***$10,321,684***	***$144,997,640***	***$160,000,000***	**6%**	***Jun 2026***
Total	**$200,390**	**$20,183,319**	**$20,383,708**	**$434,628,326**	**$511,000,000**	**4%**	**Jun 2026**

-These project have funding through both the IAP Rate Mechanism and the Electric Stipulated Base, the Stipulation Budget for these projects refers to the IAP Rate Mechanism funding. Additional details of the split between IAP Rate Mechanism and Stipulated Base spend is provided in* ***Section II.B.5.*

As shown in **Table 1**, in the first two quarters of the IAP, PSE&G incurred approximately $20.4 million in total actual costs representing 4% of the overall budget and split nearly evenly between the IAP Rate Mechanism and the Stipulated Base components of the Program. Of this $20.4 million in actual spend, the majority came within the Open Wire Secondary Upgrades under the Stipulated Base and the Spacer Upgrade projects under the IAP Rate Mechanism. These two projects are planned to be the first completed under the Program, with the Open Wire Secondary Upgrades forecasted for completion by the end of 2023 and the Spacer Upgrade projects forecasted for completion by June 2024. For the other projects, the primary activities during this initial period centered around planning and preliminary engineering.

The forecasts shown in **Table 1** for the individual projects that comprise the IAP are reflective of the status of the planning and preparation for these projects as of the end of 2022. For instance, as of the end of 2022 the projects within the Electric Outside Plant subprogram had a total forecast equivalent to the Stipulation budget as the detailed forecasts from each of the Divisions was still being developed at this time. For the Electric Stipulated Base forecast, the forecast of approximately $127.6 million is approximately $15.0 million under the Stipulation budget for the Electric Stipulated Base spend, this is due to PSE&G allocating $15.0 million of the Electric Stipulated Base funding to the 4kV Station Modernization subprogram, which is currently forecasted to be completed under budget (see **Table 6** for additional detail on the split between the IAP Rate Mechanism and the Stipulated Base).

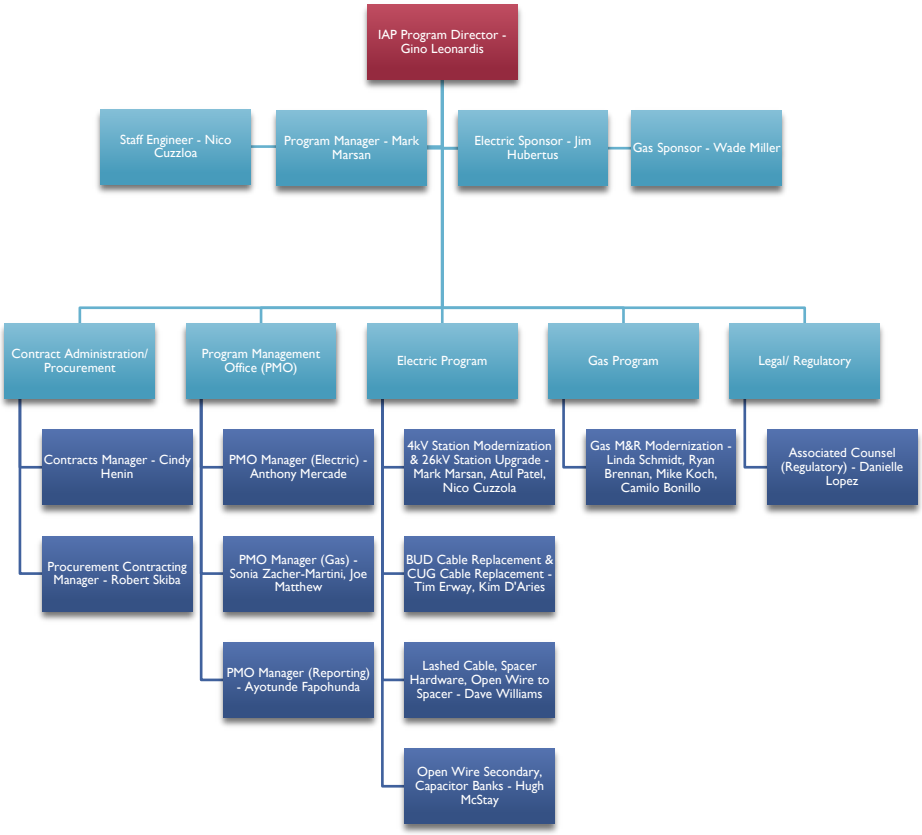
Conclusions

- In this initial reporting period of July-December 2022, the bulk of the work on the IAP involved initial planning and alignment, along with the start of engineering and field inspections. In August and September 2022, PSE&G received Program internal funding approval from its Utility Review Board (URB) for the subprograms and major projects that comprise the IAP. In the fourth quarter of 2022, construction began on the first set of projects in the Program.
- For the larger, more traditional projects, including the 4kV Station Modernization projects and the Gas M&R Station Modernization projects, efforts have focused on planning, identifying and beginning procurement of long lead items, and preliminary engineering reviews ahead of the detailed engineering commencing in 2023 and construction commencing in 2024 (and 2025 for the final two Gas M&R projects).
- The physical construction/installation work on the projects within the IAP will be performed by a mix of internal PSE&G crews, Division resources, and contractors. For the Substation Modernization and Gas M&R Station Modernization projects, the bulk of the work will be performed by construction contractors (some of the outside plant work will be performed by the Divisions), while for the Electric Outside Plant and Electric Stipulated Base projects, the work will be performed utilizing a mix of Division resources and contractors, balancing the skill sets and availability of the Divisions to the specific scopes of work. In general, PSE&G seeks to utilize internal resources when feasible, appropriate, and when such resources are available, supplementing with contractor resources as necessary.
- For many of the Electric Outside Plant projects within the IAP PSE&G has identified an assumed scope of work (e.g. number of circuits to be improved) based on a preliminary estimated cost per unit and the approved Stipulation budget. However, because of the variety in field conditions and installation effort required for the distinct projects, the cost per unit is expected to change based on these actual conditions. PSE&G intends to use the first few circuits for each subcomponent to establish a baseline estimate and will update its scope targets on a quarterly basis once it has sufficient actual costs data to inform this effort.
- The prioritization criteria for the Electric Outside Plant projects is generally driven by the recent observed performance of the circuits, including specifically outages that were related to the scope of work (e.g. Lashed Cable Replacement prioritization criteria includes filtering for lashed cable related outages), along with cost-benefit assessments to ensure the selected projects represent an efficient use of the Program funds in achieving the Program objectives. Details of the specific prioritization criteria for these projects is discussed in each of the project sections.
- While there has only been limited work performed on the Program through the end of 2022 and limited actual data to evaluate and compare performance, the actual performance of the few completed circuits reflected better performance than the 5-year SAIDI average.

II. Program Status

To carry out the IAP, PSE&G established a program management organization that established leads for the projects within the Program and the primary functional support involved in delivering the Program (contract administration, Program Management Office (PMO), and legal/regulatory). **Figure 1 – IAP Organization** shows this program management organization established by PSE&G.

Figure 1 – IAP Organization



In supporting the delivery of the Program, the PMO manages all schedule and financial related tasks on the Program, including monitoring and controlling of costs and schedule. These efforts include creation of work breakdown structures (WBS) for the entire scope of work, managing work orders, monitoring cost forecasts, reporting in-service costs, managing schedule updates, and related efforts.

Following the BPU approval of the Stipulation via its June 29, 2022 Order (with an effective date of July 1, 2022), PSE&G sought internal funding approval for each of the subprograms that comprise the IAP from its Utility Review Board (URB).

In August 2022, PSE&G requested authorization of $423.8 million in funding, aligning with the Stipulation established budget for the electric portions of the Program, including both the IAP Rate Mechanism ($281.2 million) and Stipulated Base ($142.6 million) amounts. This request also sought the release of $218.6 million in funds towards the Electric Outside Plant subprogram, which is split between IAP Rate Mechanism funds ($91 million) and Stipulated Base funds ($127.6 million). The URB approved funding levels for the projects under the Electric Outside Plant subprogram are presented in **Table 2 – Electric Outside Plant URB Approvals**.

Table 2 – Electric Outside Plant URB Approvals

Project	URB Approved Funding		
	IAP Rate Mechanism	Stipulated Base	Total
Space Cable Conversion	$42,000,000	$0	$42,000,000

Project	URB Approved Funding		
	IAP Rate Mechanism	Stipulated Base	Total
Lashed Cable Replacement	$14,000,000	$0	$14,000,000
Spacer Hardware Upgrades	$15,000,000	$0	$15,000,000
CUG Cable Replacement	$8,000,000	$15,000,000	$23,000,000
Voltage Optimization	$12,000,000	$24,600,000	$36,600,000
Buried Underground Distribution (BUD) Cable Replacement	$0	$70,000,000	$70,000,000
Open Wire Secondary Upgrades	$0	$18,000,000	$18,000,000
Total	**$91,000,000**	**$127,600,000**	**$218,600,000**

These approved funding amounts reflect the Office level estimate developed by PSE&G for the individual projects. Due to the nature of these projects (smaller, repetitive type work) with defined budgets, but without a specifically defined scope (e.g. number of units, feet of cable, etc.), PSE&G is not using risk and contingency (R&C) in these budgets and intends to use the actual costs from the initial installations to inform the forecast for the remaining work on the subprogram. While the specific Electric Outside Plant scopes reflect smaller, repetitive projects that are inherently flexible as to exact quantities to be installed (which is ultimately based on the observed cost per unit that can vary depending on the specific characteristics of each individual project), PSE&G's initial scope assumptions for each of the projects within this subprogram are as follows:

1. Spacer Cable Conversion: to replace approximately 57 miles of aging 3-phase open wire with new spacer cable type construction.
2. Lashed Cable Replacement: to replace approximately 14 miles of lashed cable with spacer cable construction.
3. Spacer Hardware Upgrades: to replace approximately 300 miles of existing construction with new hardware.
4. CUG Cable Replacement: to replace approximately 34 miles of cable.
5. Voltage Optimization: to replace approximately 1,050 aging 13kV pole top capacitors and switches.
6. BUD Cable Replacement: to replace approximately 1,400 sections with new cable and single-phase transformers.
7. Open Wire Secondary Upgrades: to replace approximately 600 secondary locations of open wire secondary.

In September 2022, PSE&G sought the release of the balance of the Program funding for the electric scope, specifically $133.4 million towards the Substation Modernization subprogram. As with the Electric Outside Plant subprogram, this approved funding includes both IAP Accelerated Recovery and Stipulated Base funds, with the breakdown shown in **Table 3 – Substation Modernization URB Approvals**.

Table 3 – Substation Modernization URB Approvals

Project	URB Approved Funding		
	IAP Rate Mechanism	Stipulated Base	Total
4kV Station Modernization	$157,200,000	$15,000,000	$172,200,000
26kV Station Upgrade	$33,000,000	$0	$33,00,000
Total	**$190,200,000**	**$15,000,000**	**$205,200,000**

The individual projects that comprise the 4kV Station Modernization subprogram have their estimates provided in **Section III.B.2.**, however, in summary, the five substations approved by the Stipulation for inclusion in the subprogram have Study level estimates that total $108.0 million as the Base estimate, with $64.2 million currently assigned as R&C. Likewise, the 26kV Station Upgrade project, which anticipates replacement of approximately 40 26kV oil circuit breakers had its Office level estimate approved, which included $25.4 million as the Base estimate with $7.6 million in R&C, for a total estimate of $33.0 million.

Also in September 2022, PSE&G sought URB approval for the authorization of $87.2 million towards the Gas M&R Station Modernization subprogram, including release of $64.6 million in funding. The $64.6 million reflects the total Base estimate from the current Study Level estimates for the four Gas M&R projects, with $22.6 million currently assigned to R&C (individual project estimates are provided in **Section III.C.**). The approved funding split between the IAP Accelerated Recovery and Stipulated Base funds is shown in **Table 4 – Gas M&R Station Modernization URB Approvals**.

Table 4 – Gas M&R Station Modernization URB Approvals

Project	URB Approved Funding		
	IAP Rate Mechanism	Stipulated Base	Total
Gas M&R Station Modernization	$69,800,000	$17,400,000	$87,200,000
Total	**$69,800,000**	**$17,400,000**	**$87,200,000**

A. Key Decisions

To capture formalized key decisions that have an influence on the Program scope or execution, PSE&G continues to utilize a "Record of Decision" (ROD) form that includes a description of the decision, alternatives considered, the decision made, and the rationale for the decision. The RODs are assessed by the IM as they are completed to review their impact, if any, to the Program.

As of the end of 2022, one ROD was completed by PSE&G on the Program titled "Electric Stimulus – Inside Plant." This ROD was actually approved in September 2021, ahead of the Program itself being approved through the Stipulation that had an effective date of July 1, 2022. This ROD was prompted by the determination that the 26kV OCBs and the 4kV station equipment at identified stations (40th Street, McLean Blvd., Teaneck, Tonnelle Ave., and Totowa) had an average 5-year likelihood of failure above the recommendations established in PSE&G's Distribution Planning Criteria. With this determination, PSE&G effectively had two options: 1) a "business as usual" approach using base capital to complete the identified investments as funding allows; or 2) execute this work under an infrastructure investment subprogram.

To evaluate these options, PSE&G engaged Black and Veatch to conduct a cost benefit analysis, which found that following the "business as usual" approach would be more costly due to the additional sequencing required to complete this scope of work, future corrective maintenance costs, future failure costs, and future cost of capital. Overall, Black and Veatch found that the "business as usual" approach would cost 15% higher for the 26kV OCB scope and 30% higher to rebuild the 4kV substations. Thus, based on the identified cost benefits and the qualitative benefits of performing this work, PSE&G selected to proceed with performing this work through the IAP. This ROD effectively established and confirmed the intent and scope for the Substation Modernization subprogram ahead of the Stipulation.

Conclusions

- While this ROD predates the approval of the IAP, it established PSE&G's rationale for selecting the 26kV Station Upgrade and 4kV Station Modernization projects that comprise the Substation Modernization subprogram.
- The cost-benefit analysis performed for PSE&G confirms that executing this work through the IAP is the more cost-effective solution than deferring this work until other funding options are available or the existing equipment fails.

B. Cost Assignments

PSE&G's cost accounting is managed and controlled through SAP, an enterprise planning, accounting, and reporting software system. It is module-based, and the Company uses it as its system tool for general ledger, finance, and accounting/control (but not fixed assets).

PSE&G's accounting practices are subject to Generally Accepted Accounting Principles (GAAP), as well as Federal Energy Regulatory Commission (FERC) practices and relevant instructions as contained in the Uniform Systems of Accounts. In addition, the company is subject to Financial Accounting Standards Board (FASB) pronouncements as they relate to rate regulated entities, and practices accepted and/or mandated by the BPU. Finally, the Company is subject to the Sarbanes-Oxley Act of 2002, and specifically here, section 401, as it relates to accurate recording of fixed asset values. Collectively, this documentation provides the guidance needed to ensure proper accounting treatment.

For placing IAP investments in-service, PSE&G's follows a standard process for determining when an asset is used and useful based on the type of investment, with electric inside plant (IP) and Gas M&R projects having one process and electric outside plant having another, reflective of the types and durations of these projects. These processes are described as follows:

- Electric IP & Gas M&R: when an asset is placed in-service, the project team issues a notification to internal stakeholders and updates the in-service tracker to indicate WBS that should be placed in-service along with the specific timing. This in-service tracker is used to place the WBS components that are listed for that month in-service in SAP.
    - For electric, in-service is identified by the first circuit cutover to put load on the switchgear, with the balance of cutovers treated as direct in-service.
    - For gas, in-service is identified by gas flowing from the transmission system operators through PSE&G's Gas M&R station and into its gas distribution system.
- Electric OP: these investments are universally treated as direct in-service as the construction is completed in under 60 days and the associated assets are energized and carrying load.

There are a variety of general accounting areas the IM will be monitoring arising from the provisions of the Stipulation. These general areas are described in the following subsections.

Findings & Observations:

- In review of PSE&G accounting practices and processes, the IM finds PSE&G's accounting for IAP projects is consistent with past infrastructure investment programs and is in alignment with GAAP, FERC regulations, and other related policies and practices.

1. Costs of Removal (COR)

The Stipulation calls for separate disclosure of COR in each rate adjustment filing and in each 12-month filing as part of the minimum filing requirements. The IM will be reviewing and disclosing charges to COR arising from the Program.

The IM intends to disclose gross COR in its periodic reporting but will track salvage values as well for accounting and ratemaking reconciliation purposes.

2. Construction Work-in-Progress (CWIP)

Proper capitalization of costs covers considerations ranging from when initial capitalization should begin as costs are recorded in Construction Work-in-Progress (CWIP) accounts, to the ultimate transfer of costs to plant-in-service for financial accounting and ratemaking purposes. The IM has reviewed the existence of documentation for each stage in this process, as noted below:

- Most projects begin with preliminary planning work before presentation to the relevant committees in the Company's capital approval process. To qualify as eligible for capitalization, project costs must, among other things, be approved as potentially part of the Company's long-term plan or mandated by regulators and proceed along a path in the capital approval process. If the project is denied at any point, costs are expensed. When the project is ultimately approved, costs incurred are journaled to a CWIP capital account. The account where pending costs are held is reviewed and approved quarterly for disposition. Projects will be charged to or transferred into CWIP if they exceed $5,000 and take in excess of 60 days to complete, among other parameters. This also begins the capitalization of allowance for funds used during construction (AFUDC).

- Once a project is substantially complete and ready for its intended use, or is otherwise energized and carrying load, and/or is considered used and useful, it is transferred out of CWIP to plant-in-service. The responsible operating department notifies the Property Accounting department of the in-service date, and actual costs plus trailing costs are added to plant-in-service. AFUDC also ceases. This is the normal progression for accumulation and disposition of project costs.

Finally, the appropriate costs will be credited to depreciation reserve and debited to depreciable plant. As a result, no gains or losses will be recorded in the retirement of utility plant.

3. Allowance for Funds Used During Construction (AFUDC)

The Stipulation permits recovery of AFUDC on IAP projects in addition to the maximum $351.0 million of costs eligible for recovery under the IAP Rate Mechanism. The Stipulation also stated accrual of AFUDC should be calculated using the same methodology used for other distribution assets and

consistent with Company policy. The IM will be reviewing and disclosing both the amounts of AFUDC accrued and the Company's calculations of the AFUDC rate on an on-going basis.

The Company's practices with respect to AFUDC are in accordance with Electric/Gas Plant Instruction 3(17) of the FERC's Uniform Systems of Accounts prescribed for public utilities (formerly FERC Order 561).

4. Allocated Overheads

The Company follows a philosophy of allocating costs, whether at the Service Company or from utility support organizations, to the operating company or unit receiving the benefit, and ultimately, if appropriate, assigning the costs to individual assets. Where possible, services are charged directly to the entity receiving the benefit based on either fully loaded hourly rates multiplied by the number of hours spent, or through a transactional count multiplied by a predetermined unit cost. Where direct charging is not possible, cost allocations from the Service Company to operating companies are prescribed in a BPU-approved schedule issued pursuant to a BPU order issued in July 2003, as amended by a subsequent BPU order issued in June 2022. The Stipulation calls for the Company to follow its current practices with regard to capitalized costs, including overheads. Cost allocations are performed automatically at each monthly closing within the Company's SAP system.

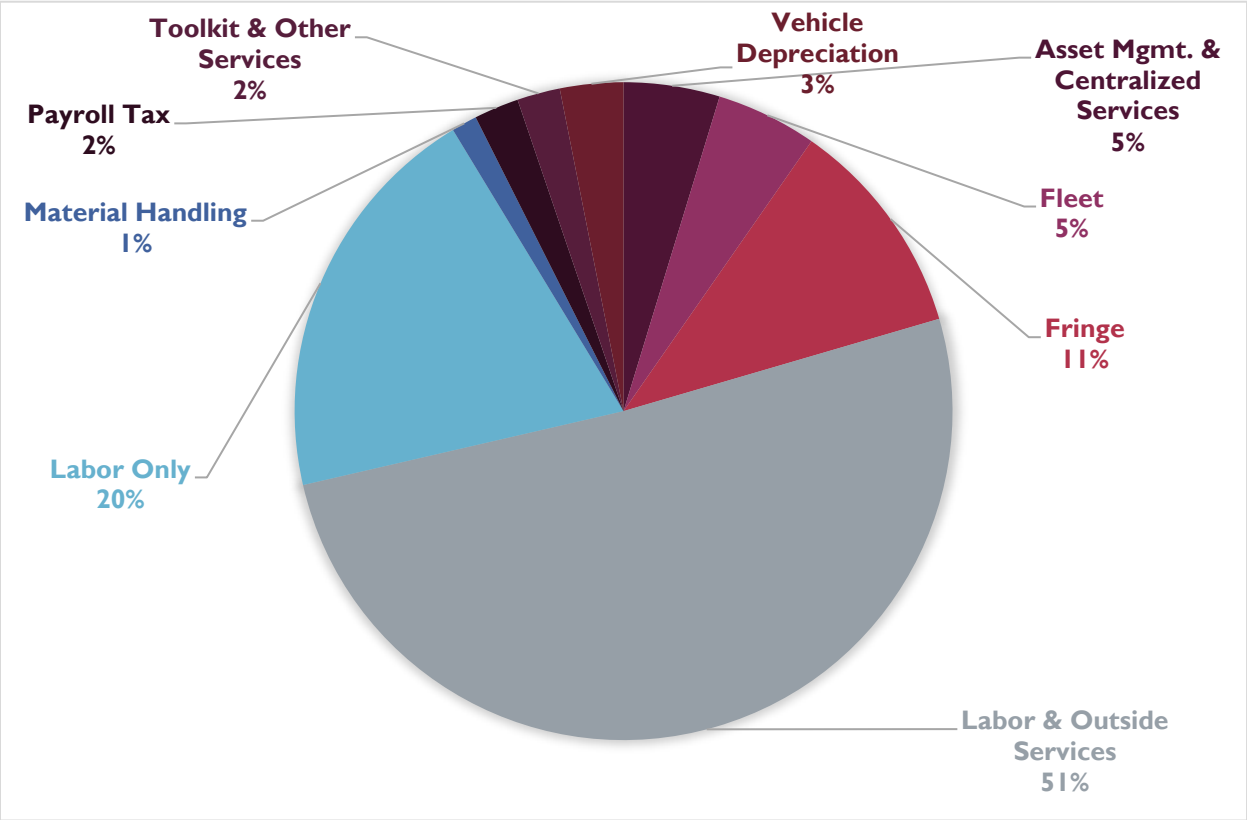
The allocated overheads recorded on the IAP during the third and fourth quarters of 2022 are presented below in **Table 5 – IAP Allocated Overheads as of December 31, 2022**.

Table 5 – IAP Allocated Overheads as of December 31, 2022

Project	Q3 2022	Q4 2022	Total
Electric Outside Plant			
Spacer Cable Conversion	$0	$0	$0
Lashed Cable Replacement	$854	$452,303	$453,157
Spacer Hardware Upgrades	$285	$1,405,342	$1,405,627
CUG Cable Replacement	$1,438	$616,462	$617,900
Voltage Optimization	$285	$52,451	$52,736
Substation Modernization			
26kV Station Upgrade	$0	$163,928	$163,928
4kV Station Modernization	$0	$79,196	$79,196
Gas M&R Station Modernization			
Gas M&R Station Modernization	$0	$52,773	$52,773
Accelerated Recovery Subtotal	*$2,862*	*$2,822,454*	*$2,825,316*
Electric Stipulated Base			
BUD Cable Replacement	$8,975	$288,607	$297,582
Open Wire Secondary Upgrades	$118,586	$4,282,598	$4,401,184
Electric Stipulated Base Subtotal	*$127,560*	*$4,571,205*	*$4,698,765*
Grand Total	**$130,422**	**$7,393,658**	**$7,524,080**

The incurred overheads to date on the IAP align the with total spend on the Program, with the projects having the most total spend to date (Open Wire Secondary Upgrades, Spacer Hardware Upgrades, CUG Cable Replacement, and Lashed Cable Replacement) also incurring the most overheads. In **Figure 2 – Q3-Q4 2022 Allocated Overheads Categorization**, the breakdown of total incurred overheads on the Program in the second half of 2022 by overhead category is provided.

Figure 2 – Q3-Q4 2022 Allocated Overheads Categorization



As shown in **Figure 2**, the overheads incurred on the Program to date have predominantly been associated with labor (either through the Labor & Outside Services category or the Labor Only category, that collectively represent approximately $5.3 million, or 71%, of the $7.5 million in overheads to date).

5. IAP Rate Mechanism vs. Stipulated Base

The full Program as approved through the Stipulation authorized $351.0 million in investments to be made under the IAP Rate Mechanism and $160.0 million in investments within Stipulated Base, for an overall Program budget of $511.0 million. While the individual projects within the Program are generally eligible for spend from either the IAP Rate Mechanism or the Stipulated Base, PSE&G's intent is to apply spend concurrently towards the IAP Rate Mechanism (where applicable) and Stipulated Base, based on project execution plans and available resources. The IM will use this section to highlight the actual spend between these two components of the Program for each of the projects as shown in **Table 6 – IAP Rate Mechanism vs. Stipulated Base Spend as of December 31, 2022**. Note that projects will be added to the Stipulated Base portion of **Table 6** as that spend is incurred and as of the end of 2022 only the BUD Cable Replacement and Open Wire Secondary Upgrades projects had recorded Stipulated Base spend.

Table 6 – IAP Rate Mechanism vs. Stipulated Base Spend as of December 31, 2022

Subprogram/Project	Q3 2022 Actual Costs	Q4 2022 Actual Costs	Total Actual Costs	Budget	Actuals % of Budget
IAP Rate Mechanism					
Electric Outside Plant					
Spacer Cable Conversion	$0	$0	$0	$42,000,000	0%
Lashed Cable Replacement	$1,394	$1,290,876	$1,292,270	$14,000,000	9%
Spacer Hardware Upgrades	$555	$5,222,157	$5,222,712	$15,000,000	35%
CUG Cable Replacement	$4,454	$1,357,373	$1,361,827	$8,000,000	17%
Voltage Optimization	$555	$95,385	$95,940	$12,000,000	1%
Substation Modernization					
26kV Station Upgrade	$0	$607,285	$607,285	$33,000,000	2%
4kV Station Modernization	$0	$585,535	$585,535	$157,200,000	0%
Gas M&R Station Modernization					
Gas M&R Station Modernization	$0	$896,456	$896,456	$69,800,000	1%
IAP Rate Mechanism Total	**$6,958**	**$10,055,067**	**$10,062,025**	**$351,000,000**	**3%**
Stipulated Base*					
Electric Outside Plant					
BUD Cable Replacement	$17,641	$775,754	$793,395	$70,000,000	1%
Open Wire Secondary Upgrades	$175,791	$9,352,498	$9,528,289	$18,000,000	53%
CUG Cable Replacement	$0	$0	$0	$15,000,000	0%
Voltage Optimization	$0	$0	$0	$24,600,000	0%
Substation Modernization					
4kV Station Modernization	$0	$0	$0	$15,000,000	0%
Electric Stipulated Base Total	**$193,432**	**$10,128,252**	**$10,321,684**	**$142,600,000**	**7%**
Gas M&R Station Modernization					
Gas M&R Station Modernization	$0	$0	$0	$17,400,000	0%
Stipulated Base Total	**$193,432**	**$10,128,252**	**$10,321,684**	**$160,000,000**	**6%**

-As the Stipulation only established Stipulated Base funding levels for the electric and gas scopes, without further detail of the electric subprograms/projects, the Stipulated Base budget figures represent the funding levels as approved by PSE&G's URB as discussed within **Section II, with additional detail on the Electric Stipulated Base project costs within **Section III.D.**.*

C. System Performance

The IM scope of work included a task to review and report "On the Impact of the Spacer Cable Conversion, Lashed Cable Replacement, Spacer Upgrade and CUG Cable Replacement Projects on

Overall System Performance during Severe Weather Events." As not every period will be impacted by severe weather events, the review of system performance will also include review of the circuits that have received investments through the IAP in Non-Major Events.

Conclusions

- During this initial Program reporting period of July-December 2022, there were minimal investments completed from which to evaluate performance, including no major events in PSE&G's service territory during this period.
- Despite the limited investments completed, the work completed to date has demonstrated improved circuit performance compared to the recent circuit performance.

1. Major Event Performance

During the current reporting period of July-December 2022, there were no Major Events reported in PSE&G's service territory.

2. Non-Major Event Performance

The performance data for the second half of 2022 for the circuits completed by subprogram are provided below. While there has only been limited work performed on the Program through the end of 2022 and limited actual data to evaluate and compare performance, the actual performance of the few completed circuits reflected better performance than the 5-year SAIDI average.

Spacer Hardware Upgrades

Circuit	5-Year Benchmark SAIDI	Q3-Q4 2022 Performance		
		SAIFI	CAIDI	SAIDI
SPF 8022	0.24229	0.00058	39.36	0.02281

Lashed Cable Replacement

Circuit	5-Year Benchmark SAIDI	Q3-Q4 2022 Performance		
		SAIFI	CAIDI	SAIDI
DUM 4007	0.00743	-	-	-

Note: there was no recorded outage on the DUM 4007 circuit after the investments were completed. DUM 4007 was also selected as part of the Dumont station circuits (also including DUM 4004 and DUM 4005).

Spacer Cable Conversion (Open Wire to Spacer)

No circuits have been completed as of the end of 2022.

CUG Cable Replacement

Circuit	5-Year Benchmark SAIDI	Q3-Q4 2022 Performance		
		SAIFI	CAIDI	SAIDI
RFL 8012	0.10116	0.00007	89.00	0.00612
FMT 8014*	0.02823	-	-	-
FMT 8025*	0.05434	0.00001	19.00	0.00027

Circuit	5-Year Benchmark SAIDI	Q3-Q4 2022 Performance		
		SAIFI	CAIDI	SAIDI
*-Note: prior to a circuit conversion, FMT 8014 was SWT 8001 and FMT 8025 was SWT 8002. The circuit conversion caused the name to change and the previous SAIDI not included in the 5-year benchmark SAIDI data. The 5-year benchmark SAIDI shown in this table reflects the combined data of FMT 8014/SWT 8001 and FMT 8025/SWT 8002.				

III. Subprogram & Project Status

A. Electric Outside Plant

The Electric Outside Plant subprogram features five projects that focus on overhead and underground facilities that supply customers from the substations to the customers' meters, including:

1. Spacer Cable Conversion (also known as Open Wire to Spacer);
2. Lashed Cable Replacement;
3. Spacer Hardware Upgrades;
4. CUG Replacement; and,
5. Voltage Optimization (also known as Capacitor Bank Upgrades).

For planning and execution purposes, PSE&G developed a program execution plan (PEP) for the full Electric Outside Plant subprogram and also included related projects eligible under Electric Stipulated Base in the PEP, including:

1. BUD Cable Replacement; and,
2. Open Wire Secondary Upgrades.

The Electric Outside Plant PEP consolidates the relevant subprogram information, including stakeholder requirements, project descriptions and scopes, benefits and justifications, a subprogram organizational chart, and provides the instructions and processes to be followed for scope and project management. Key aspects of the project management sections of the PEP include:

- Cost Budgeting:
    - Monitor and control overall budget to ensure alignment with the allocated funds and planned spend as well as prudency.
    - The first few circuits for each sub-component will be used as the basis for estimates and to establish an initial baseline. The cost per unit (CPU) will be tracked and updated monthly, with the CPU informing the forecast for the remaining work.
    - Two primary aspects of cost budgeting – the plan, established as part of the annual cost planning process; and the monthly estimate at completion (EAC) forecast, updated based on actuals to date and to-go forecasts. Changes in the cost planning and forecasting will be monitored and controlled at a portfolio level to make sure project expenditures are prudent and within the approved project specific scopes.
    - Each Division will also update the costs per month by considering how many units (miles, sections, devices, etc.) will be engineered and installed each month. Actual cost trends and updated estimates will be incorporated into the forecast.

- Cash Flow Forecasting:
    - Cash flow will indicate the full project cash flow to completion on a monthly basis. Any significant changes or projected changes in contract schedules, payment disbursements, or other financial obligations that can impact the cash flow of the budget will be identified and reported.
    - On a monthly basis, after actuals from the previous period are finalized, the to-go cash flow will be updated. The updated cash flow will be compared to the approved subprogram and Program funding amounts. Where shortfalls exist, efforts will be taken to mitigation such shortfalls, including identifying surpluses that may be used to offset shortfalls.
- Schedule Management:
    - High level subprogram reporting schedule, updated monthly.
    - Tracking high level activities by project in Excel spreadsheets.
- Licensing & Permitting:
    - All permits will be obtained by the respective Division performing the work. Division Engineering groups will determine which permits, if any, are required and make the appropriate applications. Jobs are held until the proper permits are obtained and then turned over to the Division for scheduling and execution of the work.
- Construction:
    - The Program is management centrally, with execution through PSE&G's four electric Divisions and supplemented by contractor resources. The Division departments (Engineering, Overhead Construction, Relay, SCADA, and Operations) work under Division construction procedures and handbooks.
    - Engineers create work packages consisting of sketches, work orders, material requirements, etc. All work packages are reviewed and approved following standard Division engineering processes. Jobs are engineered and reviewed by supervisors and Senior Technicians to ensure the package is ready for construction.
    - Division and PSE&G's Projects & Construction (P&C) supervisors monitor and control construction activities to ensure the work is completed in alignment with PSE&G's safety, engineering, and construction standards.
    - P&C will provide daily oversight of all contractor crews that are supporting the IAP.

The PEP also includes discussion on project authorization, invoice management, quality assurance and quality control, health and safety management, status reporting and communications, contract administration, procurement, commissioning, and project closeout, among other items relevant to the planning, execution, monitoring, and control of the projects.

Conclusions

- The Electric Outside Plant PEP was found by the IM to be complete and in alignment with common industry standards and best practices and provides an appropriate basis from which PSE&G can plan, execute, monitor, and control the Electric Outside Plant projects.

1. Spacer Cable Conversion (Open Wire to Spacer)

"The Company will invest up to $42.00 million to replace aging 3-phase open wire construction (cross arm and armless) with new spacer cable type construction. Spacer cable is a more compact and reliable design that incorporates a conductor with a thick polymer covering, thereby making it especially resilient to branch and tree contacts." (IAP Stipulation)

In planning for the Spacer Cable Conversion work, the prioritization criteria established by PSE&G for this scope of work is based on a calculated ranking using:

- Open wire construction and tree cause codes only; and,
- Updated cost-benefit data from the prior seven years (2016-2022).

By utilizing reliability data for the prior seven years, it allows PSE&G to have a common circuit list for the similar work carried out under the Energy Strong 2 Electric Stipulated Base Outside Plant-Higher Design Standards (OP-HDS) work. PSE&G's initial plan is to execute these projects beginning in 2024 carrying through to the Program end date in June 2026, as such there has been no work performed on these projects and no costs incurred through the end of 2022.[1]

The list of circuits identified for Spacer Cable Conversion projects and the 5-year average CAIDI and SAIFI for each circuit is shown below in **Table 7 – Spacer Cable Conversion Circuit Metrics**.

Table 7 – Spacer Cable Conversion Circuit Metrics

Circuit	CAIDI		SAIFI	
	Non-Major Event 5-Yr. Avg.	Tree-Related Event 5-Yr. Avg.	Non-Major Event 5-Yr. Avg.	Tree-Related Event 5-Yr. Avg.

CRX 8006	49.85	64.66	0.00110	0.00020

[1] Note: in early 2023, PSE&G made the decision to transition the Open Wire to Spacer work initially planned for the Energy Strong 2 Program to the IAP due to limited funding available in the Electric Stipulated Base portion of the Energy Strong 2 Program. Thus, Spacer Cable Conversion work will now commence in 2023 instead of the originally planned 2024. Later in 2023, six of the circuits identified were re-transitioned back to the Energy Strong 2 Program based on available funding.

Circuit	CAIDI		SAIFI

**-These circuits were removed from the IAP and re-included as part of the Energy Strong 2 Program in the fourth quarter of 2023 based on available funding in the Energy Strong 2 Program (note: the Space Cable Conversion projects utilize the same circuit selection criteria as the Outside Plant-Higher Design Standards (OP-HDS) work within the Electric Stipulated Base portion of the Energy Strong 2 Program).*

Conclusions

- While minimal work has been performed to date on the Spacer Cable Conversion project, the IM finds the prioritization criteria established by PSE&G for individual project selection is an appropriate basis from which to select projects as it focuses on outages driven by tree contact, which this type of investment is intended to alleviate by making that cable more resilient, and further by using updated cost-benefit data to support cost effectiveness in delivering this scope of work.

2. Lashed Cable Replacement

"The Company will invest up to $14.00 million to replace lashed cable with spacer cable construction. Lashed primary cable consists of three (3) conductors that are wrapped together with a bonding ribbon and suspended from pole to pole with clamps. This construction type is used for 4kV applications primarily in urban areas, backyards, or right of ways with limited construction space. Lashed cable is one of the oldest distribution assets on PSE&G's system." (IAP Stipulation)

In planning the Lashed Cable Replacement projects, the prioritization criteria established by PSE&G for this scope of work is based on a calculated ranking using:

- Lashed cable cause codes only; and,
- Updated cost-benefit for the prior five years (2018-2022).

The prioritization criteria also uses updated circuit miles to reflect only lashed cable construction in lieu of the entire circuit mileage (used on the original circuit list in the IAP filing). This also resulted in two circuits being removed from the Program, with OAK 4008 having received upgrades outside of the IAP and MCL 4007 unlikely to be completed in the Program based on current cost forecasts and the priority of this circuit on the overall list. Identified circuits are then grouped by station to determine the overall cost-benefit and to gain efficiencies while taking outages since the circuit lengths are relatively short. A photo example of the lashed cable work is provided below in **Figure 3 – Lashed Cable Photo Example**.

Figure 3 – Lashed Cable Photo Example

Following the commencement of the Program in July 2022, PSE&G commenced engineering on the initial set of circuits selected to receive investments under the Lashed Cable Replacement project. As of the end of 2022, engineering packages were prepared for 15 circuits, with two commencing construction, and one of those being completed and placed in-service in November 2022 (circuit DUM 4007 in the Palisades Division). The current status of the Lashed Cable Replacement project is provided below in **Table 8 – Lashed Cable Replacement Project Status as of December 31, 2022**.

Table 8 – Lashed Cable Replacement Project Status as of December 31, 2022

Target # of Circuits	Target # of Miles	Engineering Packages Complete	Construction Started	In-Service	Total Miles In-Service
		(# of circuits)			
TBD	14	15	2	1	0.30

Of the 15 engineering packages completed as of the end of 2022, the circuits and their respective estimated mileage, project budget, and 5-year average CAIDI and SAIFI metrics are provided below in **Table 9 – Lashed Cable Replacement Project Detail**.

Table 9 – Lashed Cable Replacement Project Detail

Circuit	Estimated Mileage	5-Year Avg. CAIDI	5-Year Avg. SAIFI	Project Budget
DUM 4004	0.31	3.40	0.00003	$306,104

WAV 4015	0.14	58.61	0.00073	$138,080
WAV 4017	0.20	11.00	0.00003	$204,527
WAV 4018	0.47	108.80	0.00090	$472,197

The forecasted and actual costs by period are shown below as compared to the current URB approved budget for the project in **Table 10 – Lashed Cable Replacement Project Costs as of December 31, 2022**. As of December 2022, the forecast reflected the work planned for 2022 only as PSE&G continued to develop and plan the work for the full Program.

Table 10 – Lashed Cable Replacement Project Costs as of December 31, 2022

Division	Q3 Actual Cost	Q4 Actual Cost	Total Actual Costs	Forecast	Budget
Central	$139	$48,566	$48,705	*Division forecasts under development*	$14,000,000
Metro	$978	$148,012	$148,990		
Palisades	$139	$1,077,576	$1,077,714		
Southern	$139	$16,722	$16,861		
Total	**$1,394**	**$1,290,876**	**$1,292,270**	**$14,000,000**	**$14,000,000**
% of Actuals to Forecast & Budget				**9%**	**9%**

As shown in **Table 10**, the bulk of the actual costs to date has occurred in the Palisades Division, which reflects the outcome of the initial prioritization for project selection and the availability of the Division to start on the work. Additionally, for the one circuit completed as of the end of 2022 (DUM 4007), its estimated cost was $301,261 and actual costs for this circuit were approximately $972,530.

As of the end of 2022, PSE&G is forecasting that the final Lashed Cable Replacement projects will go in-service in June 2026.

Conclusions

- The prioritization criteria established by PSE&G for the Lashed Cable Replacement projects is an appropriate basis to plan the work as it targets the circuits that had outages stemming from

lashed cable. By using updated cost-benefit data and grouping the projects by station should provide cost effectiveness in delivering this scope of work.

- Using updated circuit miles to show only lashed cable construction in lieu of the entire circuit mileage (used on the original circuit list in the IAP filing) is appropriate way to track the work and more accurately capture the investments made.

3. Spacer Hardware Upgrades

"The Company will invest up to $15.00 million to replace aging spacer components along existing construction with new hardware that is designed to a higher and more resilient standard. The new spacer standard has higher insulation values, improved material properties and better mechanical performance, and is expected to improve the reliability on these circuits at a relatively low cost compared to circuit construction." (IAP Stipulation)

The circuits identified by PSE&G for the Spacer Hardware Upgrades are based on the original circuit list included in the IAP filing with the prior year's SAIFI ratings providing the prioritization criteria from that list. Planning for this work begins with an evaluation of the identified circuits, looking at the end-to-end condition and identifying the required components. Execution of this work is being performed by a contractor that was awarded through a competitive bid process.

The bid process for the Spacer Hardware Upgrades work followed standard PSE&G procurement processes and included bids received from five contractors. PSE&G's bid evaluation considered technical considerations, such as bid package completeness, technical exceptions, and safety and experience, and commercial considerations, namely pricing. The selected contractor had the third lowest evaluated price, though other lower price bidders were removed from consideration as they were being considered for award for PSE&G's Defective Pole Replacement Program. PSE&G's contract strategy for these scopes was to award this IAP work and the Defective Pole Replacement Program (which was split into a north territory and south territory scope) to three separate contractors in order to maintain diversity in its supplier utilization. In addition, the IAP scope is much smaller than the Defective Pole Replacement Program, which will also allow the selected IAP contractor the opportunity to continue to develop and become a more experienced overhead contractor for PSE&G.

In receiving URB approval for the Spacer Hardware Upgrades project (discussed in **Section II**), PSE&G initially assumed the total scope would contemplate approximately 300 circuit miles, which is dependent on the cost variations driven by existing field conditions encountered (e.g. damaged cross arms, missing ground wires, etc.) and other location-specific drivers, such as the distinct traffic control requirements of each local jurisdiction in which these projects are being executed. As of the end of 2022, PSE&G updated its assumption based on revised estimates and initial actual costs data to reflect a current scope of approximately 125 circuit miles and since the start of the Program through the end of 2022, 22.5 circuit miles have received Spacer Hardware Upgrades. The current list of circuits targeted for Spacer Hardware Upgrades is provided below in **Table 11 – Spacer Hardware Upgrades Circuit Detail**.

Table 11 – Spacer Hardware Upgrades Circuit Detail

Division	Station	Circuit	Circuit Mileage

Palisades	Saddle Brook	SAD 8034	2.20
Palisades	Saddle Brook	SAD 8044	1.01
Southern	Deptford	DFD 8007	3.30

The forecasted and actual costs by period are shown below as compared to the current URB approved budget for the project in **Table 12 – Spacer Hardware Upgrades Project Costs as of December 31, 2022**.

Table 12 – Spacer Hardware Upgrades Project Costs as of December 31, 2022

Division	Q3 Actual Cost	Q4 Actual Cost	Total Actual Costs	Forecast	Budget
Central	$139	$1,497,781	$1,497,920	$4,169,178	$15,000,000
Metro	$139	$856,829	$856,967	$4,052,084	
Palisades	$139	$2,670,108	$2,670,246	$6,016,655	
Southern	$139	$197,439	$197,578	$762,089	
Total	**$555**	**$5,222,157**	**$5,222,712**	**$15,000,006**	**$15,000,000**
% of Actuals to Forecast & Budget				**35%**	**35%**

As of the end of 2022, one circuit within the Spacer Hardware Upgrade projects was completed, SPF 8022, which upgrades to 3.71 circuit miles and had an estimated cost of $683,612 compared to actual costs of $629,063. The individual Division forecasts shown in **Table 12** reflects the location of the circuits on the original circuit list, which had few circuits in the Southern Division. As of the end of 2022, PSE&G is forecasting that the final Spacer Hardware Upgrade projects will go in-service in June 2024.

Conclusions

- Starting with the original circuit list and prioritizing based on the prior year's SAIFI ratings is an appropriate method to prioritize the work to provide a structure on which the investments are most likely to have reliability improvements.

4. Conventional Underground (CUG) Cable Replacement

"The Company will invest up to $8.00 million to replace the poorest performing conventional underground cables that have reached end of life. Conventional underground cable systems are most common in urban environments, and this asset class includes cable, splices, and terminations." (IAP Stipulation)

The prioritization criteria established by PSE&G for the CUG Cable Replacement projects is based on a calculated ranking using:

- CUG cause codes only;
- Focused on the 10% poorest performing circuits (number of incidents and minutes) for the prior five years (2018-2022);
- 5-year average faults per mile; and,
- 5-year average customer minutes interrupted.

From the start of the Program through the end of 2022, the primary actions on this project involve manhole inspections, which to date have identified minimal required modifications. As of the end of

2022, approximately one mile of cable had been replaced out of a forecasted scope of 34 miles, with three circuits completed and in-service (SWT 8002, SWT 8001, and RFL 8012). PSE&G has observed minor material shortages for these projects, but does not anticipate impacts from these shortages as the resources that perform this work are generally working higher priority jobs at this time. In the interim, PSE&G is also evaluating other procurement options for the cable to ensure the availability meets the needs of the Program.

The estimated and actual costs of the three circuits placed in-service as of the end of 2022 are provided below in **Table 13 – CUG Cable Replacement Completed Project Estimated vs. Actual Costs as of December 31, 2022**.

Table 13 – CUG Cable Replacement Completed Project Estimated vs. Actual Costs as of December 31, 2022

Circuit	Miles Replaced	Estimate	Actual Cost	Variance
RFL 8012	0.06	$72,449	$57,131	($15,318)
FMT 8014	0.14	$102,284	$120,500	$18,216
FMT 8025	0.03	$45,103	$66,896	$21,793

In **Table 14 – CUG Cable Replacement Costs as of December 31, 2022** the breakdown of actual costs incurred by Division is provided compared to the current forecasts.

Table 14 – CUG Cable Replacement Costs as of December 31, 2022

Division	Q3 Actual Cost	Q4 Actual Cost	Total Actual Cost	Total Forecast	Budget*
Central	$0	$140,833	$140,833	$2,352,203	$23,000,000
Metro	$0	$790,290	$790,290	$15,947,218	
Palisades	$2,227	$294,261	$296,488	$2,436,161	
Southern	$2,227	$131,989	$134,216	$2,264,418	
Total	**$4,454**	**$1,357,373**	**$1,361,827**	**$23,000,001**	**$23,000,000**
% of Actuals to Forecast & Budget				**6%**	**6%**
**-Includes $8.0 million under the IAP Rate Mechanism and $15.0 million under Stipulated Base.*					

As indicated in **Table 14**, the majority of the CUG Cable Replacement work will be within the Metro Division, reflecting this Division having the most underground cable. As of the end of 2022, PSE&G is forecasting that the final CUG Cable Replacement projects will go in-service in June 2026.

Conclusions

- The prioritization criteria established by PSE&G for the CUG Cable Replacement scope is an appropriate basis to identify and the select the poorest performing circuits to receive these investments.
- Material shortages have been identified as a risk, but have not had a material impact on the project at this time and PSE&G is evaluating alternative procurement options to mitigate this risk.

5. Voltage Optimization (Capacitor Bank Upgrades)

"The Company will invest up to $12.00 million to replace aging 13kV pole top capacitors and switches that are increasingly failing and providing poor voltage regulation.." (IAP Stipulation)

The aging pole top capacitors and switches being replaced through this project will be replaced with digital capacitors that provide real-time data (compared to the existing analog devices that have no direct method to determine statuses).

The prioritization criteria established by PSE&G for the Voltage Optimization projects beings with the list of stations identified in the IAP filing, with PSE&G planning to select at least one station from each Division and complete all capacitors from the selected stations (no partial networks). The initial stations selected for capacitor bank upgrades include: Kilmer – 110 capacitors (Central Division); Levittown – 141 capacitors (Southern Division); Pierson – 60 capacitors (Central Division); Saddle Brook – 101 capacitors (Palisades Division); and West Caldwell – 97 capacitors (Metro Division). The total number of stations ultimately included in the Program will be determined by the actual costs incurred against the Stipulation budget (including Stipulated Base funding), though at this time the list of stations identified in PSE&G's IAP filing (within Schedule EFG-IAP-11) remains current for the targeted stations. In receiving URB approval for the Voltage Optimization projects (discussed in **Section II**), PSE&G assumed approximately 1,050 pole tap capacitors and switches will be replaced through the IAP. Based on revised estimates developed since that time, PSE&G updated its assumptions and revised the estimated scope to 504 capacitors. The main drivers to the updated cost estimate and resulting reduction in number of planned capacitors for the Program includes current vendor pricing and actual costs per unit observed in similar work (such as recloser installations).

In the fourth quarter of 2022, PSE&G initiated sample power factor testing on identified stations for optimization modeling. A pilot installation was performed in December 2022 on the LEV 8002 circuit ahead of the execution of the full scope of work. This pilot project included the engineering, procurement, equipment installation, and functional testing on the circuit. PSE&G also finalized the procurement package for the Voltage Optimization projects, with the material for these projects is expected to be received in the second half of 2023, delivery of which will inform the execution strategy for this work.

In **Table 15 – Voltage Optimization Costs as of December 31, 2022** the breakdown of actual costs incurred by Division is provided compared to the current forecasts.

Table 15 – Voltage Optimization Costs as of December 31, 2022

Division	Q3 Actual Cost	Q4 Actual Cost	Total Actual Costs	Total Forecast	Total Budget*
Central	$139	$30,053	$30,192	$9,214,600	$36,600,000
Metro	$139	$7,432	$7,571	$9,260,550	
Palisades	$139	$7,194	$7,332	$9,124,919	
Southern	$139	$50,706	$50,845	$8,999,927	
Total	**$555**	**$95,385**	**$95,939**	**$36,599,996**	**$36,600,000**
% of Actuals to Forecast & Budget				**0%**	**0%**
**-Includes $12.0 million under the IAP Rate Mechanism and $24.6 million under Stipulated Base.*					

The minimal amount of costs incurred through the end of 2022 reflects the work performed to date, which as noted above involved the commencement of sample power factor testing and the execution of the pilot project. As of the end of 2022, PSE&G is forecasting that the final Voltage Optimization projects will go in-service in June 2026.

Conclusions

- Performing a pilot project ahead of the full scope of work allows PSE&G to validate and/or update its planning assumptions to support efficient execution of the full scope.

B. Substation Modernization

As of the end of 2022, the PEP for the Substation Modernization subprogram was still being developed by PSE&G. The IM will review and report on it in a future report, similar to the Electric Outside Plant PEP discussed in **Section III.A.** of this report.

1. 26kV Station Upgrade

"The Company will invest up to $33.00 million to replace existing 26kV oil circuit breakers ('OCBs') with newer gas circuit breakers at various switching and substations across the Company's system. The OCBs have an average age of 60 years, require significant corrective maintenance, and pose environmental challenges." (IAP Stipulation)

PSE&G anticipates this scope of work will feature the replacement of approximately 40 26kV OCBs at various switching stations and substations. Stations were selected for inclusion in this subprogram based on an analysis utilizing criteria including equipment age and condition, maintenance costs, and if station upgrades were planned within the next 10 years (if so, such stations were removed from consideration). During the design and planning process, field inspections are performed at the stations to identify and assess any aspects of the station that could influence the quality of breaker performance (disconnect switches, protective relays, etc.) with the station-specific scope adjusted based on this review. While the upgrades are planned to be implemented following the completion of the total station-specific design, breaker failures can and have occurred, which prompts PSE&G to advance the engineering to complete the replacement of the failure breaker earlier than planned to return the station to service. Under these scenarios, only the equipment that fails is initially replaced, which allows the return to service to occur as soon as possible, but does not complete the full scope of the station.

In September 2022, PSE&G submitted the Office level estimate for the 26kV Station Upgrade scope of work, which included $25.4 million as a Base estimate and $7.6 million in R&C, for a total of $33.0 million, aligned with the Stipulation budget. Since the IAP filing, PSE&G reviewed and updated its list of stations to receive 26kV Station Upgrades with stations that have planned upgrades over the next 10 years removed from the Program and replaced with additional stations that meet the age and condition criteria used for the original list (in addition to not having planned upgrades in the near future). **Table 16 – Original vs. Current 26kV Station Upgrade Projects** below summarizes the changes from the scope as of the IAP filing to the current scope for these projects. Overall, the original IAP filing scope for the 26kV Station Upgrade projects identified 40 breakers at 14 stations while the current scope includes 36 breakers at 17 stations.

Table 16 – Original vs. Current 26kV Station Upgrade Projects

Station	Breakers	Status
Arcola	1	Part of IAP filing, remains in Program.
Athenia	1	In IAP filing was identified with 5 circuits, since then a new non-IAP project was developed that removed 4 breakers from the scope. Prior to this plan being developed, one breaker at Athenia failed that was replaced under the IAP.
Bloomfield	8	Part of IAP filing, remains in Program.
Bound Brook	4	Added to Program after IAP filing.
Brunswick	1	Part of IAP filing, remains in Program.
Burlington	1	Part of IAP filing, remains in Program.
Camden	4	Removed from Program due to planned upgrades within next 10 years.
Cherry Hill	1	Part of IAP filing, remains in Program.
Chester	1	Part of IAP filing, remains in Program.
Clark	2	Added to Program after IAP filing.
Culver Avenue	2	Part of IAP filing, remains in Program.
Haddon Heights	1	Part of IAP filing, remains in Program.
Haldeon	2	Added to Program after IAP filing.
Henry Street	2	Added to Program after IAP filing.
Lawrence	6	Removed from Program due to planned upgrades within next 10 years.
Mechanic	2	Added to Program after IAP filing.
Metuchen	6	Removed from Program due to planned upgrades within next 10 years.
Princeton	2	Part of IAP filing, remains in Program.
Raritan Valley	2	Added to Program after IAP filing.
South Orange	1	Added to Program after IAP filing.
Westwood	2	Part of IAP filing (1 breaker), remains in Program (updated to 2 breakers).

During the fourth quarter of 2022, engineering commenced on the first four OCB replacements, with one project advancing at each of PSE&G's four Divisions. By the end of 2022, engineering was completed on three of these four projects, with the one OCB replacement at the Athenia substation installed in December 2022 that was a breaker failure replacement, with the remaining scope to be completed in the fall of 2023. PSE&G also confirmed with the IM that it currently has adequate inventory in stock to support the project needs.

In **Table 17 – 26kV Station Upgrade Costs as of December 31, 2022** below, the total actual costs incurred through the end of 2022 are shown compared to the current forecast and budget.

Table 17 – 26kV Station Upgrade Costs as of December 31, 2022

Project	Q3 Actual Cost	Q4 Actual Cost	Total Actual Costs	Total Forecast	Total Budget
Total	**$0**	**$607,285**	**$607,285**	**$33,000,000**	**$33,000,000**
% of Actuals to Forecast & Budget				**2%**	**2%**

As of the end of 2022, PSE&G is forecasting that the final 26kV Station Upgrade projects will go in-service in May 2026.

Conclusions

- The criteria used for selecting 26kV stations to receive IAP investments appropriately considers the age and maintenance cost of the station equipment and if the station is already scheduled to receive upgrades.
- While PSE&G develops engineering packages for each station, partial scopes of work may be executed to address equipment failures at particular stations. In these scenarios, the focus is on returning the station to service, meaning the remaining scope will be performed at a later time following the completion of engineering.
- As of the end of 2022, one OCB had been replaced out of an assumed scope of 40 OCBs. The unit replaced was at the Athenia switching station and was an emergency replacement for the failed equipment, which was on the IAP priority list for replacement.

2. 4kV Station Modernization

"The Company will invest up to $157.2 million to modernize 4kV switchgear at certain electric distribution 69/4kV substations, including replacing and upgrading breakers, disconnects, reactors, regulators, relays, and other infrastructure. The following five (5) substations are included within the Project:

- *Fortieth Street*
- *McLean Blvd*
- *Teaneck*
- *Tonnelle Ave*
- *Totowa"*

(IAP Stipulation)

For the five projects identified in the Stipulation for the 4kV Station Modernization scope, PSE&G submitted Study level estimates to its URB for approval in September 2022. The scope description and estimate for each of these projects is provided in **Table 18 – 4kV Station Modernization Scope and Study Level Estimates**.

Table 18 – 4kV Station Modernization Scope and Study Level Estimates

Project	Scope	Estimate (Base)
40th Street	Replace existing 4kV feeder rows with 10 circuit breakers and a half aisle switchgear with associated voltage regulators and reactors feeder rows, two transformer breakers, construction two 4kV capacitor banks, and eliminate obsolete 4kV equipment.	$19,200,000
McLean Blvd	Replace existing 4kV feeder rows with a two-tier assembly including: an 18 breaker ring bus installed on the second story to include three transformer breakers, 14 feeder rows installed at grade level, and elimination of obsolete 4kV equipment.	$23,800,000
Teaneck	Replace existing 4kV feeder rows with a two-tier assembly including: an 18 breaker ring bus installed on the second story to include three transformer	$23,500,000

Project	Scope	Estimate (Base)
	breakers, 14 feeder rows installed at grade level, and elimination of obsolete 4kV equipment.	
Tonnelle Ave	Offload existing station with a contingency set up of two units subs and install new 4kV eight circuit breaker and a half sheltered-aisle switchgear with eight associated voltage regulators and reactor feeder rows and three 4kV dedicated transformer head breakers, and elimination of obsolete 4kV equipment.	$18,100,000
Totowa	Replace existing 4kV feeder rows with a 10 circuit breaker and half-aisle switchgear with associated voltage regulators and reactor feeder rows, two transformer breakers, and elimination of obsolete 4kV equipment.	$23,400,000
R&C/Placeholder	R&C for the subprogram	$64,200,000

Beyond the projects listed above, the URB submittal also approved $64.2 million as a placeholder/R&C funds for the 4kV Station Modernization scope of work, which includes $15.0 million in Stipulated Base funding and $49.2 million through the IAP Rate Mechanism.

In **Figure 4 – 4kV Station Modernization Project Status as of December 31, 2022** below, a high-level summary of the major project activities for each project are shown with the planned durations.

Figure 4 – 4kV Station Modernization Project Status as of December 31, 2022

Project	Status Point	2022		2023				2024				2025				2026		Program End Date - June 30, 2026
		Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	
40th Street	**Dec. 2022**			DR					C					IS		CO		
McLean Blvd.	**Dec. 2022**			DR				C				IS	CO					
Teaneck	**Dec. 2022**			DR				C				IS	CO					
Tonnelle Ave.	**Dec. 2022**			DR							C		IS		CO			
Totowa	**Dec. 2022**		DR						C					IS		CO		
Legend: DR = Key Drawing Review; C = Construction; IS = Fully In-Service (major assets in-service); CO = Closeout																		

As shown in **Figure 4**, for most of 2023, the primary activities on the 4kV Station Modernization projects will be the advancement of engineering and long-lead procurement activities ahead of the start of construction in 2024. The next major milestone for the five 4kV Station Modernization projects will be the issuance of the switchgear PO in the first quarter of 2023. In preparing the switchgear procurement, PSE&G implemented lessons learned from its Energy Strong 2 Program experience such as incorporating progress milestone payments on the switchgears and will continue to have regular meetings with its vendors (PSE&G is using Powell and Powercon as the switchgear vendors). The forecasted in-service dates for the 4kV Station Modernization projects are all within 2025, with four of the five projects projected for a first quarter 2025 in-service date and the other projected for a fourth quarter 2025 in-service date.

During the second half of 2022, detailed engineering commenced on the 40th Street and Totowa projects, both of which are using internal PSE&G resources for the engineering scope. For the other three projects (McLean Blvd., Teaneck, and Tonnelle Avenue), PSE&G intends to issue POs for the detailed engineering scope in the first quarter of 2023. Use of internal versus external engineering

resources on these projects is determined by the project's scope, complexity and the availability of internal resources. For McLean Blvd. and Teaneck, the design involves an over/under concept with the switchgear installed above the feeder rows due to the very tight site space available. In preparing these projects, PSE&G's team reviewed the Energy Strong 2 Plainfield project, which has a similarly small site and over/under design concept and utilized the same A/E as the McLean Blvd. and Teaneck projects (Black and Veatch). In addition to the site space restrictions, another challenge to the execution of these projects is the requirement for contingency plans for four of the five stations (all but 40th Street, which will require reconfiguration outside the station) to allow portions of the stations to remain in-service while the work is carried out.

In **Table 19 – 4kV Station Modernization Costs as of December 31, 2022** below, the actual costs incurred through the end of 2022 are shown for each project compared to the current forecasts.

Table 19 – 4kV Station Modernization Costs as of December 31, 2022

Project	Q3 Actual Cost	Q4 Actual Cost	Total Actual Costs	Total Forecast	Total Budget*
40th Street	$0	$169,958	$169,958	$19,003,700	$19,200,000
McLean Blvd.	$0	$65,861	$65,861	$22,968,575	$23,800,000
Teaneck	$0	$87,612	$87,612	$22,730,454	$23,500,000
Tonnelle Ave.	$0	$70,678	$70,678	$18,156,804	$18,100,000
Totowa	$0	$191,426	$191,426	$18,214,557	$23,400,000
R&C/Placeholder	-	-	-	-	$64,200,000
Total	**$0**	**$585,535**	**$585,535**	**$101,074,091**	**$172,200,000**
% of Actuals to Forecast & Budget				**1%**	**0%**
**-Includes $157.2 million under the IAP Rate Mechanism and $15.0 million under Stipulated Base.*					

Conclusions

- Through the end of 2022, only preliminary work has commenced on the 4kV Station Modernization subprogram. However, PSE&G's planning for this work has appropriately considered the experience from similar work carried out under the Energy Strong 2 Program.

C. Gas M&R Station Modernization

"In the Gas Metering and Regulating ('M&R') Station Modernization Subprogram, PSE&G will modernize its M&R stations by phasing out outdated designs, upgrading stations to series regulation design with a second level of overpressure protection for enhanced safety and reliability, and replacing aging equipment and facilities. The Company will make up to $69.80 million of Program investment to comply with U.S. Department of Homeland Security Transportation Security Administration regulations, as well as, toward modernizing the following four (4) M&R stations:

- *Brooklawn*
- *Hillsborough*
- *Hamilton*
- *Hanover"*

(IAP Stipulation)

"The Company shall spend a total of $160 million on certain capital projects during the Program term that will not be recovered through the IAP Rate Mechanism… The remaining $17.4 million [after accounting for the Electric Stipulated Base portion] *will be used to complete any of the gas M&R station upgrades specified above in Paragraph 8* [the four stations listed in the Gas M&R Station Modernization subprogram, plus Trenton, Roseland, and West Deptford]."
(IAP Stipulation)

As shown in the above excerpts from the Stipulation, the IAP Rate Mechanism portion of the Gas M&R Station Modernization budget was established at $69.8 million, which is to be applied toward modernizing the four gas M&R stations identified in the Stipulation. The $17.4 million portion of the Stipulated Base allocated for the Gas M&R Station Modernization efforts indicated it would be used towards the completion of the initial four stations and/or for three additional stations identified. Given the overlapping nature of the IAP Rate Mechanism and the Stipulated Base portions of the Gas M&R work within the Program, the IM will report on the Gas M&R projects collectively under this section, while also indicating the split in spend between the IAP Rate Mechanism and the Stipulated Base.

In **Figure 5 – Gas M&R Station Modernization Project Status as of December 31, 2022** below, a high-level summary of the major project activities for each project are shown with the planned durations.

Figure 5 – Gas M&R Station Modernization Project Status as of December 31, 2022

Project	Status Point	2022		2023				2024				2025				2026		Program End Date - June 30, 2026
		Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	
Brooklawn	Dec. 2022			DD					C		IS		CO					
Hillsborough	Dec. 2022			DD					C		IS		CO					
Hamilton	Dec. 2022			DD								C			IS		CO	
Hanover	Dec. 2022			DD									C		IS		CO	
Legend: DD = Detailed Design; C = Construction; IS = Fully In-Service (major assets in-service); CO = Closeout																		

As shown in **Figure 5**, PSE&G has planned the execution of the Gas M&R projects such that each project will commence detailed design early in 2023, with Brooklawn and Hillsborough planned to advanced to construction in the second quarter of 2024 and going in-service by the end of 2024, followed by Hamilton and Hanover going into construction in early 2025 ahead of their forecasted in-service dates late in 2025.

During the second half of 2022, PSE&G had completed review of the preliminary design drawings and P&IDs for each of the Gas M&R stations. The bidding process for the A/E work associated with each of the projects was also initiated in the second half of 2022, with award of the A/E contracts planned for early 2023. As of the end of 2022, the PEP for the Gas M&R Station Modernization subprogram was still being developed by PSE&G, the IM will review and report on it in the next quarterly report, similar to the Electric Outside Plant PEP discussed in **Section III.A.** in this report.

Following the experience of the Gas M&R subprogram within the Energy Strong 2 Program, PSE&G has implemented various lessons learned in its approach to the Gas M&R projects within the IAP, including:

- Conducting an upfront investigation of existing conditions at each site, including a buildings hazardous assessment, Geotech soil borings, gathering as-built drawings, and verifying NJDEP flood area regulations (these stations are outside of flood areas);
- Moving procurement earlier in the process to allow more risk mitigation options and more control over the release of materials;
- Using an A/E firm to develop early designs to support the Study Level/50% estimates;
- Ensuring the scope identifies security, IT/telecom, and cathodic protection requirements;
- Contractor bid package using issued for construction (IFC) drawings instead of issued for bid (IFB) drawings;
- Engaging internal PSE&G engineering for additional civil and electrical drawing reviews;
- Gaining synergies and cost efficiencies by having two A/E firms each execute two of the four projects; also using a staggered execution approach to better balance the work load and allowing more flexibility in planning and mitigation responses; and,
- Bringing the commissioning aspects into the design considerations.

PSE&G submitted Study level estimates for each of the four current Gas M&R projects to its URB for approval in September 2022. The scope description and estimate for each of these projects is provided in **Table 20 – Gas M&R Station Modernization Scope and Study Level Estimates**.

Table 20 – 4kV Station Modernization Scope and Study Level Estimates

Project	Scope	Estimate (Base)
Brooklawn	Replacement of M&R building, regulator runs, headers, station by-pass, relief valves, temporary bypass at full load, instrumentation, Remote Terminal Unit (RTU) equipment, RTU building, Mono Ethylene Glycol (MEG) unit, Scrubber, annubars, backup generator, cathodic protection, and site security features.	$14,600,000
Hamilton	Replacement of M&R building, regulator runs, headers, station by-pass, relief valves, temporary bypass at full load, instrumentation, RTU equipment, RTU building, MEG unit, annubars, Scrubber, heaters, backup generator, cathodic protection, and site security features.	$19,800,000
Hanover	Replacement of M&R building, regulator runs, headers, station by-pass, relief valves, temporary bypass at full load, heaters, instrumentation, RTU equipment, RTU building, MEG unit, gas chromatograph, backup generator, cathodic protection, and site safety features.	$17,400,000
Hillsborough	Replacement of M&R building, regulator runs, headers, station by-pass, relief valves, temporary by-pass at full load, instrumentation, RTU equipment, annubars, gas chromatograph, backup generator, cathodic protection, and security features.	$12,800,000
Placeholder/R&C	R&C for the subprogram	$22,600,000

While **Table 20** above shows the current estimate for each of the Gas M&R projects, the actual costs incurred through the end of 2022 along with the current forecasts for each of the projects is shown in **Table 21 – Gas M&R Station Modernization Cost Status as of December 31, 2022**.

Table 21 – Gas M&R Station Modernization Cost Status as of December 31, 2022

Project	Q3 Actual Cost	Q4 Actual Cost	Total Actual Costs	Total Forecast	Total Budget*
Brooklawn	$0	$290,951	$290,951	$14,600,000	$14,600,000
Hamilton	$0	$209,295	$209,295	$19,800,000	$19,800,000
Hanover	$0	$189,683	$189,683	$17,378,897	$17,400,000
Hillsborough	$0	$206,528	$206,528	$12,777,698	$12,800,000
R&C/Placeholder	-	-	-	-	$22,600,000
Total	**$0**	**$896,456**	**$896,456**	**$64,556,595**	**$87,200,000**
% of Actuals to Forecast & Budget				**1%**	**1%**
**-Includes $69.8 million under the IAP Rate Mechanism and $17.4 million under Stipulated Base.*					

As shown in **Table 21**, as of the end of 2022 the Gas M&R Station Modernization forecast was approximately $22.6 million under budget, which reflects the R&C balance (which also effectively is a placeholder for potentially adding additional projects to the subprogram, as provided by the Stipulation should the initial four projects be completed under budget).

Conclusions

- Through the end of 2022, only preliminary work has commenced on the Gas M&R Station Modernization subprogram. However, PSE&G's planning for this work has appropriately considered the experience from similar work carried out under the Energy Strong 2 Program.

D. Electric Stipulated Base

"The Company shall spend a total of $160 million on certain capital projects during the Program term that will not be recovered through the IAP Rate Mechanism… Of that $160 million, $142.60 million will be spent at the Company's discretion toward the Electric Outside Plant and/or Substation Modernization Subprograms…as well as the Buried Underground Distribution Cable Replacement Project, and the Open Wire Secondary Upgrade Project as proposed in the Company's filing." (IAP Stipulation)

As indicated above in the except from the Stipulation, the Electric Stipulated Base component of the IAP involves investments of up to $142.6 million towards additional projects under the Electric Outside Plant or Substation Modernization subprograms, and/or towards BUD Cable Replacement or Open Wire Secondary Upgrade projects that were part of PSE&G's IAP filing but not included in the accelerated recovery portion of the approved Program. As the BUD Cable Replacement and Open Wire Secondary Upgrade projects consist of work similar and related to the other Electric Outside Plant projects, PSE&G has included these projects within its Electric Outside Plant PEP discussed in **Section III.A.** above.

Within **Section II**, the PSE&G planned allocation of the Electric Stipulated Base funding as approved by its URB is shown, which has also been summarized below in **Table 22 – Electric Stipulated Base Costs as of December 31, 2022**, which shows the approved funding levels for the Electric Stipulated Base funds and current spend by project (note that for the projects with IAP Rate Mechanism funding, those funds will be expended before costs are incurred against the Electric Stipulated Base funding).

Table 22 – Electric Stipulated Base Costs as of December 31, 2022

Project	Actual Costs*	Electric Stipulated Base	% of Actuals to Stipulated Base Budget
CUG Cable Replacement	$0	$15,000,000	0%
Voltage Optimization	$0	$24,600,000	0%
4kV Station Modernization	$0	$15,000,000	0%
BUD Cable Replacement	$793,395	$70,000,000	1%
Open Wire Secondary Upgrades	$9,528,289	$18,000,000	53%
Total	**$10,321,684**	**$142,600,000**	**7%**
**-Includes spend under Stipulated Base only.*			

1. Buried Underground Distribution (BUD) Cable Replacement

The prioritization criteria established by PSE&G for BUD Cable Replacement project selection is based on a calculated ranking using:

- BUD cause codes only;
- Focused on the 10% poorest performing circuits (number of incidents and minutes) for the prior five years (2018-2022);
- 5-year average faults per mile; and
- 5-year average customer minutes interrupted.

As part of the URB funding approval for the IAP (discussed in **Section II**), PSE&G assumed that the BUD Cable Replacement scope would contemplate the replacement of the 1,400 worst performing sections. Since that time, PSE&G re-prioritized the BUD cable target list that now contemplates replacement of 1,916 sections for approximately 110 miles. The prioritization of these sections will be updated by PSE&G on an annual basis to reflect the most recent reliability data, costs per unit, and the work performed to date.

During the fourth quarter of 2022, PSE&G commenced inspections on the circuits and began preliminary engineering ahead of the planned start of construction at the end of the first quarter of 2023.

In **Table 23 – BUD Cable Replacement Costs as of December 31, 2022** the breakdown of costs incurred by Division is provided compared to the current forecasts.

Table 23 – BUD Cable Replacement Costs as of December 31, 2022

Division	Q3 Actual Cost	Q4 Actual Cost	Total Actual Costs	Total Forecast	Total Actual Cost % of Forecast
Central	$3,077	$301,196	$304,273	$21,191,652	1%
Metro	$0	$35,304	$35,304	$3,497,883	1%
Palisades	$11,894	$257,648	$269,542	$10,577,803	3%
Southern	$2,670	$181,606	$184,276	$34,732,662	1%
Total	**$17,641**	**$775,754**	**$793,395**	**$70,000,000**	**1%**

As of the end of 2022, PSE&G is forecasting that the final BUD Cable Replacement projects will go in-service in June 2026.

Conclusions

- The prioritization criteria established by PSE&G for the BUD Cable Replacement projects is an appropriate basis to identify and the select the poorest performing circuits to receive these investments. By having annual updates of the prioritization list, it ensures the targeted investments continue to reflect the intended benefits of the Program.

2. Open Wire Secondary Upgrades

"This project will replace approximately 1,300 secondary locations of existing OWS with new secondary cable and services that have higher capacity and are also more resistant to storms and tree contacts. In addition, in areas with lower rated 25kVa transformers in place, new larger capacity units will be installed." (PSE&G's IAP Filing)

The Stipulation identified that the $142.6 million in Stipulated Base funding identified for the electric scope of the Program could be spent at PSE&G's discretion towards the approved Electric Outside Plant or Substation Modernization projects and/or used towards the BUD Cable Replacement project and the Open Wire Secondary Upgrades project identified in PSE&G's IAP filing. The scope description called out above from PSE&G's IAP filing was based on a proposed budget of $36 million and as indicated in **Table 22**, PSE&G's URB approved a budget of $18 million for the Open Wire Secondary Upgrades project, using a portion of the Stipulated Base funding. Based on this approved budget of $18 million, PSE&G will update its planned scope under this project based on the actual cost data observed in the initial installations and intends to continue to update the installation targets on a quarterly basis.

As PSE&G does not track secondary outages and secondary construction, the prioritization criteria for Open Wire Secondary Upgrades projects uses a preliminary circuit list developed by PSE&G that is based on 4kV circuits with the highest number of 25kVA transformers. This list targeted the circuits with the highest likelihood of open wire secondary construction for the PSE&G and its Divisions to perform field inspections and identify where open wire exists on these circuits. Additionally, PSE&G is using apprentice line workers for this project that provides the dual benefit of additional training through real-world experience while delivering the execution benefits.

For the circuits completed as of the end of 2022, the associated footage and estimate and actual costs are provided in **Table 24 – Open Wire Secondary Upgrades Completed Circuits as of December 31, 2022**.

Table 24 – Open Wire Secondary Upgrades Completed Circuits as of December 31, 2022

Circuit	Footage	Estimate	Actuals
CHA-4001	6,000	$81,871	$58,291
CHS-4006	10,173	$390,000	$433,814
CRA-4001	850	$46,977	$57,058
CRA-4003	7,750	$659,396	$246,627
DUM-4003	700	$64,556	$-
DUM-4004	700	$28,457	$611,731
DUM-4005	500	$76,303	$2,071
DUM-4007	12,300	$677,886	$972,530
EWI-4006	7,750	$320,000	$1,471,199
GRE-4003	11,410	$3,998	$4,506
GRE-4007	2,000	$62,318	$22,877
KEA-4001	2,000	$135,470	$122,905

Circuit	Footage	Estimate	Actuals
KEA-4008	2,000	$138,513	$123,019
TEA-4003	3,150	$251,253	$7,276
TEA-4006	4,000	$115,883	$114,969
TOT-4001 & TOT-4003	4550+1750	$581,007	$283,061
UNC-4012	1,500	$38,810	$128,831
WAR-4002	1,500	$193,034	$2,030
WOR-8018	2,000	$82,217	$100,297
Total	**82,583**	**$3,947,950**	**$4,763,092**

In **Figure 6 – Open Wire Secondary Updates Example** below, photos showing the existing open wire secondary and the updated secondary wire installed through IAP efforts are shown.

Figure 6 – Open Wire Secondary Updates Example

In **Table 25 – Open Wire Secondary Upgrades Cost Status as of December 31, 2022** the overall costs incurred by Division is provided.

Table 25 – Open Wire Secondary Upgrades Cost Status as of December 31, 2022

Division	Q3 Actual Cost	Q4 Actual Cost	Total Actual Costs	Total Forecast	Total Budget
Central	$49,797	$850,016	$899,813	$3,052,956	$18,000,000
Metro	$13,588	$2,607,519	$2,621,107	$4,688,487	
Palisades	$95,688	$3,439,228	$3,534,916	$5,757,325	
Southern	$16,718	$2,455,736	$2,472,454	$4,498,875	
Total	**$175,791**	**$9,352,498**	**$9,528,289**	**$17,997,643**	**$18,000,000**
% of Actuals to Forecast & Budget				**53%**	**53%**

As of the end of 2022, PSE&G is forecasting that the final Open Wire Secondary Upgrades projects will go in-service in December 2023.

Conclusions

- The prioritization criteria for Open Wire Secondary Upgrades project selection is based on a preliminary list of the 4kV circuits with highest number of 25kVA transformers, which have the highest likelihood of open wire secondary construction. Using this list, PSE&G and its Divisions will perform field inspections and identify where open wire secondary exists on these circuits. As PSE&G does not specifically track secondary outages and secondary construction, the IM finds this to be an appropriate basis to identify projects to receive investments.
- PSE&G's use of apprentice line workers for this project provides benefits of additional training through real-world experience while delivering the execution benefits.

PSE&G
Infrastructure Advancement Program

Independent Monitor

July-December 2022

Final Report

Appendix A – Draft Report Comments and Responses

DECEMBER 20, 2023

PEGASUS GLOBAL HOLDINGS, INC.®

Questions & Comments Formally Submitted on the IM 2022 Second Quarter Report

ID #	Question/Comment	IM Response	Report Changes
S-1	Please provide an update on the Company's efforts to obtain federal funding for any IAP projects.	PSE&G indicated to the IM that it has explored applying for federal grants under the Infrastructure Investment and Jobs Act, Pub. L. No. 117-58, 135 Stat. 429 (2021) but has not applied at this time because PSE&G has not located any such grant that applies to the investments for which the Company seeks rate recovery in this matter.	No change
S-2	**Reference PSE&G IAP July-December 2022 Draft Report, Page 2, Table 1 - IAP Overall Cost Summary as of December 31, 2022** Regarding the forecasted spending within Electric Stipulated Base ($127,597,640), please explain why this total is less than the required Electric Stipulated Base spending of $142.60 million (See PSE&G IAP Stipulation, Paragraph 11).	PSE&G's Electric Stipulated Base forecasted spend as of December 2022 includes forecasted spend for each of the Electric Outside Plant projects that comprise the Electric Stipulated Base spend (CUG Cable Replacement, Voltage Optimization, BUD Cable Replacement, and Open Wire Secondary Upgrades). PSE&G's URB approved $15.0 million of the $142.6 million in Electric Stipulated Base funding towards the 4kV Station Modernization projects. Thus, the approximate $15.0 million variance between the forecast for the Electric Stipulated Base and the Stipulation approved Electric Stipulated Base funding is attributed to the 4kV Station Modernization projects currently being forecasted under budget, which itself is reflective of these projects being in the early stages of planning and development as of the end of 2022.	**Section I**
S-3	**Reference PSE&G IAP July-December 2022 Draft Report, Page 6**	When the 4kV Station Modernization project estimates were updated, the Base estimate for each project decreased from a collective $114.8 million to $108.0 million. This $6.8 million decrease in the Base	No change

ID #	Question/Comment	IM Response	Report Changes
	Refer to the statement "The individual projects that comprise the 4kV Station Modernization subprogram have their estimates provided in Section III.B.2., however, in summary, the five substations approved by the Stipulation for inclusion in the subprogram have Study level estimates that total $108.0 million as the Base estimate, with $64.2 million currently assigned as R&C." Please discuss the need for such a large amount of risk and contingency (approximately 60%) and explain why the risk and contingency increased from original estimates (50%).	estimate total was added to the R&C/placeholder balance and maintained the overall funding level at $172.2 million (which includes $15.0 million from Stipulated Base).	
S-4	**Reference PSE&G IAP July-December 2022 Draft Report, Page 12** Regarding the circuit within the Spacer Hardware Upgrade subprogram for which work was completed by December 2022 (SPF 8022), please provide the budgeted cost, final cost, and total mileage associated with the project.	The estimated cost of the Spacer Harder Upgrade work on circuit SPF 8022 was approximately $683,612, while actual costs were approximately $629,063. The scope of this project included 3.71 miles of circuit upgrades.	**Section III.A.3.**
S-5	**Reference PSE&G IAP July-December 2022 Draft Report, Page 12** Regarding the circuit within the Lashed Cable Replacement subprogram for which work was completed by December 2022 (DUM 4007): a. Please provide the budgeted cost, final cost, and total mileage associated with the project. b. Please explain the Company's rationale for conducting this project given that the circuit's five (5)-year Benchmark SAIDI (0.00743) does not seem to indicate that there are reliability issues present. c. Please explain why the Company did not originally target this circuit for lashed cable replacement in the IAP petition (See PSE&G IAP Petition, Attachment 2, Schedule EFG-IAP-7).	The DUM 4007 circuit under the Lashed Cable Replacement subprogram had an estimated cost of $301,261 and actual costs of approximately $972,530. The IAP filing listed only five circuits representing 14 total miles and was based on the entire circuit mileage that includes sections lashed cable is not needed or required. PSE&G since updated the circuit list to reflect only the lashed cable construction in lieu of the entire circuit mileage. The prioritization is still using lashed cable outage cause codes only and uses updated cost-benefit criteria. As part of the prioritization, all circuits within a station are grouped to determine the combined circuit cost-benefit criteria. This methodology led to the inclusion of DUM 4007, which is one of three circuits related to the Dumont station (DUM 4004 and DUM 4005 are the other two).	**Section II.C.2.** and **Section III.A.2.**

ID #	Question/Comment	IM Response	Report Changes
S-6	**Reference PSE&G IAP July-December 2022 Draft Report, Page 12** Regarding the three (3) circuits within the Conventional Underground Cable Replacement subprogram for which work was completed by December 2022 (RFL 8012, FMT 8014, and FMT 8025): a. Please provide the budgeted cost, final cost, approximate age of previous cable, and total feet of cable replaced for each circuit. b. Please explain the Company's rationale for conducting these projects given that the circuits' five (5)-year Benchmark SAIDI values do not seem to indicate that there are reliability issues present. c. Please explain why these circuits were not originally targeted for underground cable replacement in the Company's petition (See PSE&G IAP Petition, Attachment 2, Schedule EFG-IAP-9).	Regarding the CUG projects for circuits RFL 8012, FMT 8014, and FMT 8025: a. The age of the cable replaced was approximately 48 years old based on PSE&Gs estimates. The budgeted and actual costs (as of Dec. 2022) are provided below: b. FMT 8014 and FMT 8025 were previously labeled as circuits SWT 8001 and SWT 8002 prior to a circuit conversion. This conversion resulted in the previous SAIDI data for SWT 8001 and SWT 8002 not being incorporated into FMT 8014 and FMT 8025, which is now corrected within **Section II.C.2.** For RFL 8012, its 5-year SAIDI was 0.10116, notably higher than the current period performance of 0.00612. c. These circuits were selected based on a updated reliability ranking performed by PSE&G in 2022.	**Section II.C.2.**
S-7	**Reference PSE&G IAP July-December 2022 Draft Report, Page 15, Footnote 1** Refer to the statement "in early 2023, PSE&G made the decision to transition the Open Wire to Spacer work initially planned for the Energy Strong 2 Program to the IAP due to limited funding available in the Electric Stipulated Base portion of the Energy Strong 2 Program." a. Please identify the circuits that will be transitioned from the Energy Strong 2 program to the IAP. b. Please provide the five (5)-year (2018-2022) SAIFI and CAIDI and five (5)-year (2018-2022) tree-related SAIFI and CAIDI for the circuits that will be transitioned from the Energy Strong 2 program to the IAP.	PSE&G has confirmed with the IM that the circuit priority list for Spacer Cable Conversion/Open Wire to Spacer investments planned for the Energy Strong 2 Program (under Electric Stipulated Base, Outside Plant-Higher Design Standard (OP-HDS)) is the same initial list utilized for the projects now planned for execution under the IAP, with the list updated annually to reflect the most recent reliability data and to update the circuit prioritization. Given that PSE&G has applied a common approach to the circuit identification and prioritization, including refreshing the data annually to ensure the list remains tied to current reliability data, the IM finds it reasonable for PSE&G to use the same circuit priority list for the Spacer Cable Conversion investments that was	**Section III.A.1.**

ID #	Question/Comment	IM Response	Report Changes
	c. Please discuss if the Independent Monitor believes that the historical reliability of the Energy Strong 2 circuits warrants prioritization over the originally planned IAP circuits.	originally developed for the OP-HDS work within the Energy Strong 2 Program. The 5-year average CAIDI and SAIFI of the circuits identified for Spacer Cable Conversion projects, including for both non-Major Event and for tree-related events, has been added to the IM report within **Table 7 – Spacer Cable Conversion Circuit Metrics**.	
S-8	**Reference PSE&G IAP July-December 2022 Draft Report, Pages 15-16, Lashed Cable Replacement** Please identify the 17 circuits currently included in the Lashed Cable Replacement subprogram and provide the following information for each circuit: a. Total miles to be replaced b. Budgeted cost c. Five (5)-year (2018-2022) SAIFI and CAIDI	The draft IM report incorrectly identified 17 engineering packages as being completed for the Lashed Cable Replacement projects, the correct total as of the end of 2022 was 15 packages. The estimated miles, budgeted cost, and 5-year SAIFI and CAIDI metrics for these 15 circuits have been added to the report within **Table 9 – Lashed Cable Replacement Project Detail**.	**Section III.A.2.**
S-9	**Reference PSE&G IAP July-December 2022 Draft Report, Pages 15-16, Lashed Cable Replacement** Please indicate if any circuits originally planned within the Lashed Cable Replacement subprogram (OAK 4008, ORA 4001, NRP 4010, MCL 4007, and RSL 4007) have been removed from the IAP. (See PSE&G IAP Petition, Attachment 2, Schedule EFG-IAP-7). If so, please discuss if the Independent Monitor believes that this decision was reasonable.	Of those five circuits identified for Lashed Cable Replacement investments within Schedule EFG-IAP-7 of the IAP filing, two have been removed from the IAP (OAK 4008 and MCL 4007) as OAK 4008 was improved by a non-IAP project and based on current cost forecasts, it was unlikely that MCL 4007 would be completed with the available funding based on its priority on the list. Additionally, PSE&G has updated its circuit list for the Lashed Cable Replacement projects to reflect both the investments made outside of the IAP and to update the circuit mileage from the full circuit length as was shown in the IAP filing (under Schedule EFG-IAP-7) to the portion of the circuit with lashed cable currently installed. As of August 2023, PSE&G had identified a total of 39 circuits comprised of approximately 8.3	**Section III.A.2.**

ID #	Question/Comment	IM Response	Report Changes
		miles of lashed cable to receive investments through the IAP.	
S-10	**Reference PSE&G IAP July-December 2022 Draft Report, Page 17, Spacer Hardware Upgrades** Refer to the statement "Execution of this work is being performed by a contractor that was awarded through a competitive bid process." Please discuss the bids received for the spacer hardware upgrades and indicate if the lowest bid was selected.	The bid process for the Spacer Hardware Upgrades work followed standard PSE&G procurement processes and included bids received from five contractors. PSE&G's bid evaluation considered technical considerations, such as bid package completeness, technical exceptions, and safety and experience, and commercial considerations, namely pricing. The selected contractor had the third lowest evaluated price, though other lower price bidders were removed from consideration as they were being considered for award for PSE&G's Defective Pole Replacement Program. PSE&G's contract strategy for these scopes was to award this IAP work and the Defective Pole Replacement Program (which was split into a north territory and south territory scope) to three contractors in order to maintain diversity in its supplier utilization. In addition, the IAP scope is much smaller than the Defective Pole Replacement Program, which will also allow the selected IAP contractor the opportunity to continue to develop and become a more experienced overhead contractor for PSE&G.	**Section III.A.3.**
S-11	**Reference PSE&G IAP July-December 2022 Draft Report, Page 17, Spacer Hardware Upgrades** Regarding the Company's decision to reduce the scope of the Spacer Hardware Upgrades subprogram from 300 circuit miles to 125 circuit miles: a. Please provide additional details explaining why actual costs are significantly higher than originally estimated. b. Please identify all circuits and associated mileage currently included within the subprogram.	Concerning the Spacer Hardware Upgrades: a. The initial scope assumption of 300 circuit miles was revised based on a review of existing field conditions and early project costs, with the higher costs driven by conditions in the field, such as damaged cross arms, missing ground wires, etc. b. The current lists of circuits in the Spacer Hardware Upgrades subprogram has been added to the report within **Section III.A.3.**	**Section III.A.3.**

ID #	Question/Comment	IM Response	Report Changes
	c. Please explain the Company's rationale for prioritizing its circuits based upon the prior year's SAIFI ratings, rather than using a larger sample size that incorporates more than one (1) year of data	c. The original circuit list to receive Spacer Hardware Upgrades reflects the 5-year average SAIFI, with the prior year SAIFI rating providing a further prioritization of that original circuit list.	
S-12	**Reference PSE&G IAP July-December 2022 Draft Report, Page 19, Voltage Optimization** Refer to the statement "PSE&G assumed approximately 1,050 pole tap capacitors and switches will be replaced through the IAP. Based on revised estimates developed since that time, PSE&G updated its assumptions and revised the estimated scope to 504 capacitors." Please provide additional details explaining why actual costs are significantly higher than originally estimated.	The main drivers to the updated cost estimate and resulting reduction in number of planned capacitors for the Program includes current vendor pricing and actual costs per unit observed in similar work (such as recloser installations).	**Section III.A.5.**
S-13	**Reference PSE&G IAP July-December 2022 Draft Report, Pages 20-21, 26kV Station Upgrade** Please indicate if the 40 oil circuit breakers currently included in the 26kV Station Upgrade subprogram are the same as those identified in the IAP petition (PSE&G IAP Petition, Attachment 2, Schedule EFG-IAP-5). If not, please explain any adjustments to the originally planned subprogram.	The IAP petition identified 40 breakers at 14 stations to receive 26kV upgrades, after review of station upgrades planned for the next 10 years, PSE&G updated the list, removing three of the original stations and adding seven additional stations, with the total number of OCBs planned for replacement now at 36. The original and current list of stations and breakers is provided in **Table 16 – Original vs. Current 26kV Station Upgrade Projects**.	**Section III.B.1.**
S-14	**Reference PSE&G IAP July-December 2022 Draft Report, Pages 24-27, Gas M&R Station Modernization** Please discuss how PSE&G's planning for the Gas M&R Station Modernization subprogram has accounted for the following lessons learned from the Energy Strong II Gas M&R projects (See Energy Strong II Independent Monitor 2022 Q2 Report, Page 45): a. Insufficient investigation in the development of the projects during front-end planning. b. Upfront scope development did not consider design and execution refinement, resulting in deviation from the	PSE&G has identified and incorporated lessons learned from its experience with the Energy Strong 2 Gas M&R subprogram, including the following areas: *a. Insufficient investigation in the development of the projects during front-end planning:* Conducting upfront investigations of the existing conditions as each site, including a buildings hazardous assessment, Geotech soil borings, collecting as-built drawings, and verifying NJDEP regulations. *b. Upfront scope development did not consider design and execution refinement, resulting in deviation*	**Section III.C.**

ID #	Question/Comment	IM Response	Report Changes
	preliminary scope as formal scope lockdown for these projects did not occur. c. Front-end planning activities were not completed, nor were all stage gates met when Study level estimates were developed by the project teams with A/E firm assistance and submitted to the URB.	*from the preliminary scope as formal scope lockdown for these projects did not occur:* Ensuring the scope includes elements such as security, IT/telecom, and cathodic protection requirements and that the design considers commissioning requirements; Using IFC drawings for the contractor bid packages rather than IFB drawings; and engaging internal PSE&G engineering resources for additional civil and electrical drawing reviews. *c. Front-end planning activities were not completed, nor were all stage gates met when Study level estimates were developed by the project teams with A/E firm assistance and submitted to the URB:* Engaging the A/E earlier in the process to develop early designs supporting the Study level/50% estimate and ensuring the upfront investigations noted above were completed.	
S-15	**Reference PSE&G IAP July-December 2022 Draft Report, Page 28, Buried Underground Distribution (BUD) Cable Replacement** For each project within the BUD Cable Replacement subprogram completed through December 2022, please provide the following: a. Circuit ID b. Budgeted cost c. Final cost d. Approximate age of previous cable e. Total feet of cable replaced f. Five (5)-year (2018-2022) SAIFI and CAIDI of each circuit	No BUD projects were completed as of December 2022. As of that time, the work performed primarily involved circuit inspections and preliminary engineering.	No change
S-16	**Reference PSE&G IAP July-December 2022 Draft Report, Page 29, Open Wire Secondary Upgrades**	The estimate and actual costs for the completed circuits as of December 2022 under the Open Wire Secondary Updates projects were added to the main report.	**Section III.D.2.**

ID #	Question/Comment	IM Response	Report Changes
	Regarding the Open Wire Secondary Upgrades projects completed through December 2022, please provide the budgeted cost and final cost of each project.		
RCR-INF-1	In reference to the draft July-December 2022 Independent Monitor report at page 2, please indicate when the Company will complete the detailed forecasts for the Electric Outside Plant subprogram.	The detailed Division forecasts for the Electric Outside Plant subprogram were completed during the first quarter of 2023 (and continue to be updated monthly).	No change
RCR-INF-2	In reference to the draft July-December 2022 Independent Monitor report at page 3, please provide the Company's most recent experiences with long-lead time items relative to delays experienced in the last 18-24 months.	PSE&G has identified certain underground cable and wooden poles has having more constrained availability recently, but has been able to manage its inventory to support project needs.	No change
RCR-INF-3	In reference to the draft July-December 2022 Independent Monitor report at page 3, please indicate if the Company has a target ratio for workforce utilization. If so, please explain how the Company manages the balance between internal Division resources and contractors.	PSE&G does not have targets for use of internal vs. contractor resources on the IAP. The Company generally seeks to execute work with internal resources when feasible, appropriate, and when such resources are available, supplementing with contractor resources as necessary.	**Section I.**
RCR-INF-4	In reference to the draft July-December 2022 Independent Monitor report at page 5, Table 2; please provide an estimated timeframe for the completion of the Stipulated Base spending. If not, please indicate when the Company will have a timetable estimate.	Based on its current forecasts, PSE&G is anticipated the Stipulated Base spend will continue through to the Program end date in June 2026.	No change
RCR-INF-5	In reference to the draft July-December 2022 Independent Monitor report at page 5, please explain why PSEG is not using risk and contingency for just the Outside Plant Program.	Smaller, repetitive type jobs have relatively minor risks compared to the larger, more typical "projects" that have more complex risk profiles. The budgets for the smaller, repetitive type jobs also effectively mean any risks realized with associated cost impacts as the effect of reducing the number of units available to be installed under a fixed budget.	No change
RCR-INF-6	In reference to the draft July-December 2022 Independent Monitor report at page 5, please explain how the experience of the first completed Outside Plant projects has affected the Company's cost and timeline estimates.	PSE&G has monitored the initial experience on the Outside Plant projects to inform the updates to the Program targets (primarily number of circuits and miles) and will continue to update these targets based on the actual costs incurred on the Program. The IM	No change

ID #	Question/Comment	IM Response	Report Changes
		will continue include the targets in its reports as of the current reporting quarter. As of the fourth quarter of 2023, PSE&G has revised its Outside Plant project targets as follows: • Lashed Cable: o Original: 116 circuits; 13 miles o Updated: 39 circuits; 8.3 miles • Spacer Hardware: o Original: 83 circuits; 300 miles o Updated: 39 circuits; 163 miles • CUG: o Original: 30 circuits; 36 miles o Updated: no change • Voltage Optimization: o Original: 1,050 pole top capacitors o Updated: 504 pole top capacitors	
RCR-INF-7	In reference to the draft July-December 2022 Independent Monitor report at page 5, please indicate if the estimated quantity of scope assumptions for the Outside Plant program is a minimum level of completed work. If not, please explain why not.	The estimated quantities listed in the report for the Electric Outside Plant projects reflect PSE&G's initial assumptions based on the funding levels of these projects, if actual costs are lower than anticipated, additional quantities may be installed, likewise, if actual costs are higher than anticipated, it may result in fewer quantities installed than currently assumed.	No change
RCR-INF-8	In reference to the draft July-December 2022 Independent Monitor report at page 9, please explain the split between internal and contract labor for the Spacer Hardware and Open Wire Secondary subprogram.	The Spacer Hardware projects are being executed primarily by contractors (98%), while the Open Wire Secondary projects are split roughly 50%/50% between contractor and internal resources.	No change
RCR-INF-9	In reference to the draft July-December 2022 Independent Monitor report at page 12, please explain why FMT 8014 has not data.	FMT 8014 and FMT 8025 were previously labeled as circuits SWT 8001 and SWT 8002 prior to a circuit conversion. This conversion resulted in the previous SAIDI data for SWT 8001 and SWT 8002 not being incorporated into FMT 8014 and FMT 8025, which is now corrected within **Section II.C.2.**	**Section II.C.2.**

ID #	Question/Comment	IM Response	Report Changes
RCR-INF-10	In reference to the draft July-December 2022 Independent Monitor report at page 12, please explain why there is no 5-yr benchmark SAIDI data for FMT 8025.	FMT 8014 and FMT 8025 were previously labeled as circuits SWT 8001 and SWT 8002 prior to a circuit conversion. This conversion resulted in the previous SAIDI data for SWT 8001 and SWT 8002 not being incorporated into FMT 8014 and FMT 8025, which is now corrected within **Section II.C.2.**	**Section II.C.2.**
RCR-INF-11	In reference to the draft July-December 2022 Independent Monitor report at page 13, please provide a copy of the Company's current program execution plan.	As this is a PSE&G document, the IM is not in a position to transmit it to other parties.	No change
RCR-INF-12	In reference to the draft July-December 2022 Independent Monitor report at page 13, please indicate what the Company's anticipate frequency for updating the full program execution plan is given that elements of the plan are updated monthly.	PSE&G updates its execution plans on an annual basis, which is common industry practice based on the IM's experience. For the project elements that are updated monthly (e.g. cost and schedule data), the PEP provides the direction and processes for updating and reviewing that type of project data, but these processes are generally consistent throughout the execution of the Program.	No change
RCR-INF-13	In reference to the draft July-December 2022 Independent Monitor report at page 15, please indicate if the Company is moving stipulated base work from the Energy Strong 2 program into the Infrastructure Advancement Program. If so, please explain the amount and what other stipulated base work projects will offset the proposed reallocation.	The Spacer Cable Conversion/Open Wire to Spacer projects have a common scope and same selection and prioritization criteria to the Outside Plant-Higher Design Standards (OP-HDS) work planned as part of the ES 2 Electric Stipulated Base work. Based on the available funding in the ES 2 Program, PSE&G transitioned this work to the IAP in early 2023. However, in the fourth quarter of 2023, PSE&G determined funding was available for some of the identified circuits to be included in the ES 2 Program, with six selected.	**Section III.A.1.**
RCR-INF-14	In reference to the draft July-December 2022 Independent Monitor report at page 15, please indicate the approximate number of circuits that are on the preliminary lists for the spacer cable conversion program.	At this time, PSE&G has identified 28 circuits planned to receive upgrades through the Spacer Cable Conversion projects. A list of these circuits and their related performance metrics has been added to the report as **Table 7 – Spacer Cable Conversion Circuit Metrics**.	**Section III.A.1.**

ID #	Question/Comment	IM Response	Report Changes
RCR-INF-15	In reference to the draft July-December 2022 Independent Monitor report at page 15, please explain why the prioritization process for the lashed cable replacement program is based on 7-years, instead of 5-years.	The Lashed Cable Replacement project selection criteria includes the cost-benefit ratio for the prior five years, while the Spacer Cable Conversion project selection criteria includes the cost-benefit ratio for the prior seven years. The Spacer Cable Conversion project selection criteria uses seven years due to its overlap with the Energy Strong 2 Program's OP-HDS work. This allows PSE&G to prioritize this common work across two Program using a combined circuit list. After the Energy Strong 2 Program ends at the end of 2023, PSE&G will reprioritize the circuit list using the current five-year reliability data (2019-2023) for the remaining circuits to be executed under the IAP.	**Section III.A.1.**
RCR-INF-16	In reference to the draft July-December 2022 Independent Monitor report at page 16, please explain if there is [a] practical transition point for the lashed cable work if only a portion of the circuit will be upgraded. Please provide some photo examples.	The lashed cable work replaced the portions of the circuit with lashed cable, which is typically from pole-to-pole. A photo example of this work was added to the main report.	**Section III.A.2.**
RCR-INF-17	In reference to the draft July-December 2022 Independent Monitor report at page 17, please explain why there is a drop in estimated miles from 300 to 125 for the proposed work.	The initial scope assumption of 300 circuit miles was revised based on a review of existing field conditions and early project costs, with the higher costs driven by conditions in the field, such as damaged cross arms, missing ground wires, etc. See also the response to **S-11**.	**Section III.A.3.**
RCR-INF-18	In reference to the draft July-December 2022 Independent Monitor report at page 17, please describe the Company's experience with the ongoing work, since approximately 1/3 of the work has been completed by the end of 2022.	The Company has identified variations in field conditions as it has performed the Spacer Hardware Upgrade work, such as damaged cross arms, missing ground wires, or circuits already upgraded. In the locations requiring permits (generally road occupancy permits), PSE&G has found that the permit approval time has typically taken 1-2 months. Later in 2023, PSE&G observed the contractor performing the work	No change

ID #	Question/Comment	IM Response	Report Changes
		was not meeting safety/human performance expectations and early in the fourth quarter of 2023 transitioned to a new contractor. Additionally, the Company is considering using Stipulated Base funds to perform additional Spacer Hardware Upgrade work, the IM will continue to report on the status of this scope as it advances.	
RCR-INF-19	In reference to the draft July-December 2022 Independent Monitor report at page 18, please explain why the Company has only found that actual conditions only require minimal modifications. Does the Company expect to spend less on the program?	The minimal manhole modifications to date simply reflect the actual conditions observed. If actual CUG project costs are lower than previously estimated, PSE&G intends to replace additional poor performing circuits in priority order until the available budgets are fully allocated.	No change
RCR-INF-20	In reference to the draft July-December 2022 Independent Monitor report at page 19, what are the shortages for materials for the conventional underground cable replacement program.	The CUG Cable Replacement projects were identified as having EPR cable as a potential risk given the current availability of this material.	No change
RCR-INF-21	In reference to the draft July-December 2022 Independent Monitor report at page 19, please explain why the Company anticipates a drop in the number of pole [top] capacitors for the voltage optimization program.	The main drivers to the updated cost estimate and resulting reduction in number of planned capacitors for the Program includes current vendor pricing and actual costs per unit observed in similar work (such as recloser installations). See also response to **S-12**.	**Section III.A.5.**
RCR-INF-22	In reference to the draft July-December 2022 Independent Monitor report at page 19, please provide an update on the Company's experience with the LEV 8002 pilot work.	On the Capacitor Bank Upgrade pilot project (LEV 8002), PSE&G encountered challenges with SCADA communication during installation that required the vendor field verify and rework the controller programming to address the calibration expected results for voltage and current capacitor operational status (open/closed). These challenges were resolved and the project was fully tested and commissioned in June 2023.	No change
RCR-INF-23	In reference to the draft July-December 2022 Independent Monitor report at page 23, please provide an update on the five stations.	Efforts through 2023 on the 4kV Station Modernization projects primarily involve ongoing design, permitting, and procurement. In August 2023, civil contingency construction commenced at Totowa.	No change

ID #	Question/Comment	IM Response	Report Changes
RCR-INF-24	In reference to the draft July-December 2022 Independent Monitor report at page 23, please explain if the Company has incorporated the experience from the Energy Strong 2 program into the planning and implementation for the proposed 4kV Modernization work.	The successful implementation of the over-under design has allowed the McLean and Teaneck 4kV Station Modernization projects to proceed under a similar approach, allowing the accommodation of large, modernized equipment at very space-constrained sites. The execution of the contingency scope of the Electric Station Flood Mitigation projects has also informed the strategy and approach to contingency planning for the IAP projects. Other aspects of the Energy Strong 2 experience that have been applied to the IAP include selecting two switchgear vendors and modifying contracting strategies to mitigate supply chain risks.	No change
RCR-INF-25	In reference to the draft July-December 2022 Independent Monitor report at page 23, please indicate if the Company utilized outside engineering for the Plainfield substation work. If so, please indicate how that will impact the proposed work for McLean Blvd. and Teaneck substations.	The Plainfield project in the Energy Strong 2 Program utilized Black and Veatch (B&V) as the A/E, the Mclean and Teaneck projects within IAP are also using B&V.	No change
RCR-INF-26	In reference to the draft July-December 2022 Independent Monitor report at page 25, please provide an update on the status of work at the four stations.	The work on the Gas M&R Station Modernization projects through 2023 focuses primarily on advancing the design, submitting permit applications, and commencing the procurement process.	No change
RCR-INF-27	In reference to the draft July-December 2022 Independent Monitor report at page 28, please explain why there is an increase in the number of circuits for the proposed work.	The increase in the planned number of circuits for the BUD Cable Replacement was the result of PSE&G's annual re-prioritization update, though remains with the same overall budget and forecast.	No change
RCR-INF-28	In reference to the draft July-December 2022 Independent Monitor report at page 29, please explain why there is no prioritization process for the open wire secondary work.	As PSE&G does not track secondary outages and secondary construction, the prioritization criteria for Open Wire Secondary Upgrades projects uses a preliminary circuit list developed by PSE&G that is based on 4kV circuits with the highest number of 25kVA transformers.	No change

<table>

ID #	Question/Comment	IM Response	Report Changes
	This information is important since the Company is not planning to use risk and contingency for the Electric Outside Plant program. This is already evident in the change in the scope assumption for the Spacer Hardware Upgrade from an initial estimate of 300 miles to the current estimate of 125 miles. Conversely, the scope of work for the BUD Cable Replacement program has increased from 1,400 sections to 1,916 sections.		
Rate Counsel 10/2 Letter	The IM noted that PSE&G conducted a pilot installation on circuit LEV 8002 for the Voltage Optimization program. The Company should keep Board Staff and Rate Counsel apprised of the progress of the Voltage Optimization pilot and if there are any synergies with the Company's ongoing smart meter rollout.	PSE&G indicated to the IM it currently does not yet have any existing synergies between the Voltage Optimization work and the Company's ongoing AMI Information System Implementation Project and is not anticipated within the framework of the IAP effort. The AMI's data gathering and modeling effort is in its very early stages. In the future, when PSE&G has sufficient data to take into consideration, PSE&G will seek to use all tools at its disposal, including AMI data, to optimize circuit voltages and better understand the effects of increased EVs and DERs on the PSE&G system.	No change
Rate Counsel 10/2 Letter	The IM noted that PSE&G's 26 kV Substation Modernization program plans to replace approximately 40 oil circuit breakers across its service territory. The Company notes that some identified breakers have and will fail prior to scheduled replacement. The replacement work may not cover the full scope of the proposed work. The Company should keep Board Staff and Rate Counsel apprised of the progress of the replacement work and if there are any opportunities to schedule the full scope of work under an oil circuit breaker failure replacement situation.	The IM will continue to monitor and report on the execution of the 26kV Station Upgrade projects. Opportunities to schedule the full scope of work at the time of a breaker failure replacement may be limited to do the availability of completed engineering and required material.	No change
Rate Counsel 10/2 Letter	The IM noted that PSE&G's 4 kV Station Modernization program includes five substations. The IM noted that the McLean Blvd. and Teaneck stations have a design that is an over/under concept with switchgear installed above the feeder rows due to space constraints. The IM noted that PSE&G's Plainfield station has similar space constraints and incorporated the over/under design concept in Energy Strong 2. Rate Counsel is interested in knowing	The successful implementation of the over-under design has allowed the McLean and Teaneck 4kV Station Modernization projects to proceed under a similar approach, allowing the accommodation of large, modernized equipment at very space constrained sites. The execution of the contingency scope of the Electric Station Flood Mitigation projects has also informed the	No change

ID #	Question/Comment	IM Response	Report Changes
	if there are learning opportunities from the Plainfield station work that would benefit the two substations.	strategy and approach to contingency planning for the IAP projects. Other aspects of the Energy Strong 2 experience that have been applied to the IAP include selecting two switchgear vendors and modifying contracting strategies to mitigate supply chain risks.	
Rate Counsel 10/2 Letter	Under the Electric Stipulated Base program, the IM noted that PSE&G does not track secondary outages and secondary construction. Therefore, the prioritization criteria for Open Wire Secondary Upgrades projects uses the Company's preliminary circuit list based on the number of 25kVA transformers. The IM notes that this list targets circuits with the highest likelihood of open wire secondary construction rather than a prioritization based on outages. As the Company rolls out smart meters, the Company should be able to track outages at a more granular level. This may be part of a retrospective analysis in the future since the Company anticipates completing the Open Wire Secondary program by the end of 2023.	The IM will continue to discuss with PSE&G the data and metrics it has available to support execution of the IAP.	No change
PSEG-1	The reference at page 22 that "the URB submittal also approved $64.2 million as a placeholder/R&C funds for the 4kV Station Modernization scope of work, which includes $15.0 million in Stipulated Base funding and $29.2 million through the IAP Rate Mechanism." Should indicate $49.2 million of the placeholder/R&C funds are under Accelerated Recovery and $15.0 in Stipulated Base.	The split between the funding sources for the 4kV Station Modernization scope has been corrected.	**Section III.A.5.**

Re: Infrastructure Advancement Program – Semi Annual Report
January 2023 to June 2023

Dear Secretary Golden:

Enclosed for filing is Public Service Electric and Gas Company's semi-annual Infrastructure Advancement Program report for the period January 2023 to June 2023.

The Infrastructure Advancement Program ("IAP") was addressed by a Board Order dated June 29, 2022 (June 29th Order) in Docket Nos. EO2111211 and GO21112121. That Order adopted a Stipulation pursuant to which PSE&G is operating the program known as IAP.

Paragraph 26 of that Stipulation requires reports on:

- The estimated total quantity of work and the quantity completed to date or, if the project work cannot be quantified with numbers, the major tasks completed, e.g., design phase, material procurement, permit gathering, phases of construction;
- The forecasted and actual IAP costs-to-date for the reporting period and for the Program-to-date; where project work is identified by major category (with the actual variances from forecasted amounts expressed in dollar and percentage terms);
- The estimated IAP Project completion date, and estimated completion dates for each IAP subprogram and the Program as a whole;
- Anticipated changes to IAP Projects, if any;
- Actual capital expenditures made by the utility in the normal course of business on similar project work, identified by major category; and
- Any other performance metric concerning the IAP required by the Board.
- For circuits improved within the Spacer Cable Conversion Project, Lashed Cable Replacement Project, and Spacer Upgrade Project, PSE&G will provide System Average Interruption Duration Index ("SAIDI") results for Major Event11 performance at the circuit level (redacted and confidential unredacted) for circuits affected by a Major Event during the reporting period and at the operating area level and system wide. The SAIDI results will be reported and measured against a baseline that reflects performance for each circuit

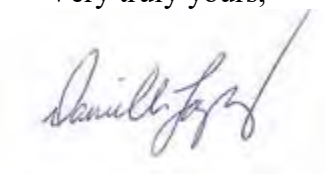
under Major Event conditions for the prior five (5) years from the Program start date. The report will include the SAIDI results at the circuit level for the reporting period.

- For circuits improved upon within the Spacer Cable Conversion Project, Lashed Cable Replacement Project, Spacer Upgrade Project, and Conventional Underground Cable Replacement Project, PSE&G will include non-Major Event performance (where a non-Major Event excludes all "Major Events" as defined at N.J.A.C. 14:5-1.2) including circuit designation (information to be provided redacted and confidential unredacted), that reflects non-Major Event conditions for the reporting period. In addition to SAIDI, the Company will report non-Major Event data for Customer Average Interruption Duration Index ("CAIDI") and System Average Interruption Frequency Index ("SAIFI"). The SAIDI results will be reported and measured against a baseline that reflects performance for each circuit under non-Major Event conditions for the prior five (5) years from the Program start date.

The reporting requirements listed in paragraph 26 of the Stipulation are addressed by the enclosed materials.

Please contact the undersigned with any questions or concerns.

Very truly yours,



Danielle Lopez

Metric 1 – Estimated Quantity of Work

For each Infrastructure Advancement Subprogram:

A. Estimated quantity of work

i. **For the Entire Subprogram**

ii. **Planned to date (based on forecasted estimates at the beginning of the reporting period)**

B. Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. design phase, material procurement, permit gathering, phases of construction;

NOTE: This quarterly report covers Program to date performance up to the 1st half of 2023 period - January 1, 2023 through June 30, 2023. At the end of the period, all subprograms/projects have advanced through varying stages of planning authorization and execution and completion. Where applicable, forecasted and actual units of work and/or major tasks completed are provided.

ELECTRIC PROGRAM

ELECTRIC INSIDE PLANT

Electric Life Cycle Stations

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the modernization of 4kV switchgear at five (5) electric distribution 69/4kV substations, including replacing and upgrading breakers, disconnects, reactors, regulators, relays, and other infrastructure. The following five (5) substations are included within the project:

- Fortieth Street
- McLean Blvd
- Teaneck
- Tonnelle Ave
- Totowa

ii. **Planned to Date:** Major work planned to the end of June 2023:

Fortieth:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings issued
- Detailed Engineering Start
- L&P package issued

McLean:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings issued

Teaneck:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued

Tonnelle:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings issued
- L&P package issued

Totowa:

- Major Equipment POs issued
- KDR package approved
- L&P package issued
- SCD permit issued
- Preliminary Vendor Drawings Issued

B. Quantity of Work Completed to Date:

Fortieth:

- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued
- Detailed Engineering Start
- L&P package issued

McLean:

- A&E contract and PO issued for detailed engineering
- Major Equipment POs issued
- KDR package approval
- Preliminary Vendor Drawings Issued

Teaneck:

- A&E contract and PO issued for detailed engineering
- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued

Tonnelle:

- A&E contract and PO issued for detailed engineering
- Major Equipment POs issued
- KDR package approved
- Preliminary Vendor Drawings Issued

Totowa:

- Major Equipment POs issued
- KDR package approval
- L&P package issued
- SCD permit issued
- Preliminary Vendor Drawings Issued

Electric Stations 26kV Oil Circuit Breakers (OCB) Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 36 Oil Circuit Breakers.

ii. **Planned to Date:** Major work planned to the end of June 2023:

Replacement of six 26kV Oil Circuit Breakers.

B. Quantity of Work Completed to Date:

Replaced four 26kV Oil Circuit Breakers.

ELECTRIC OUTSIDE PLANT

Electric Lashed Cable Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes replacing approximately 8 miles of existing lashed primary cable construction with spacer cable construction that is designed to a higher and more resilient standard.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Replacement of 1 mile of lashed primary cable with spacer cable.

B. Quantity of Work Completed to Date:

- January 2023 to June 2023 – Replaced 0.79 circuit miles.
- Program to date - Replaced 1.09 circuit miles.

Electric Open Wire to Spacer

A. Estimated Quantity of Work:

i. **Project:** This project will replace aging, 3-phase, open wire construction (cross arm and armless) with PSE&G's current standard, spacer cable type construction. Additionally, replacement work will also require the upgrading of auxiliary equipment as part of the conversion.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- No work currently planned. This program does not begin until 2024.

B. Quantity of Work Completed to Date:

- January 2023 to June 2023 – Replaced 10.21 circuit miles.
- Program to date - Replaced 10.21 circuit miles.

Electric Spacer Hardware Upgrades

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes 160 miles of existing spacer type construction. This project will replace aging spacer units along existing construction with new hardware that is designed to a higher and more resilient standard. Also, worn, defective, or metallic tangent brackets will be replaced with a newer fiberglass tangent bracket. Messenger ground wire will be installed at every pole if not currently installed.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Completion of 40 circuit miles.

B. Quantity of Work Completed to Date:

- January 2023 to June 2023 – Completed 57 circuit miles.
- Program to Date – Completed 79 circuit miles.

Electric Conventional Underground (CUG) Cable Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 34 miles of conventional underground cable.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Civil work to repair crushed conduit.
- Complete all CUG's in Palisades & Central.

B. Quantity of Work Completed to Date:

- January to June 2023 – Replaced 1.81 circuit miles of cable.
- Program to date – Replaced 6.58 circuit miles of cable.

Electric Buried Underground Distribution (BUD) Cable Replacement

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 110 miles of BUD cable.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- No Major Activities Planned.

B. Quantity of Work Completed to Date:

- January to June 2023 – Replaced 0.11 circuit miles of cable.
- Program to date – Replaced 0.11 circuit miles of cable.

Electric Capacitor Bank Upgrades

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of 479 capacitors. The following stations have been identified for this project:

- Palisades Div. – Penhorn (76)
- Metropolitan Div. – West Caldwell (169)
- Central Div. – Pierson (95)
- Southern Div. – Levittown (139)

ii. **Planned to Date:** Major work planned to the end of June 2023:

- PO for 80 units to be issued by early May 2023.

B. **Quantity of Work Completed to Date:** Major Activities completed by end of June 2023:

- PO issued in April for delivery of 80 units in 2023.
- Completed station/circuit testing for 604 existing capacitors.

Electric Open Wire Secondary Upgrades

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes the replacement of approximately 50 miles over 139 circuits of Open Wire Secondary across the entire PSEG service territory with new secondary cable that have higher capacity and are more resistant to storms and tree contacts. In addition, in areas with lower rated 25kVa transformers in place, new larger 50kVa capacity transformer will be installed.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Planned to complete 16.8 miles through June out of total estimate of 37 miles for the year 2023.

B. Quantity of Work Completed to Date:

2023 construction completion metrics by division:

- Palisades –
  - 24 circuits worked
  - 60,682 feet of wire replaced
- Metropolitan –
  - 47 circuits worked
  - 45,610 feet of wire replaced
- Central –
  - 16 circuits worked
  - 29,819 feet of wire replaced
- Southern –
  - 18 circuits worked
  - 51,123 feet of wire replaced

GAS METERING & REGULATION (M&R) STATIONS

A. Estimated Quantity of Work:

i. **Project:** The estimated quantity of work for this Subprogram includes implementation of life cycle upgrades 4 Gas M&R Stations (Brooklawn, Hamilton, Hanover, and Hillsborough) listed in the Program Stipulation and life cycle upgrades at all 4 M&R Stations as part of the IAP Gas Subprogram.

ii. **Planned to Date:** Major work planned to the end of June 2023:

- Award Detailed Design Engineering to A/E firms for all 4 Stations.
- Start Detailed Design Engineering for all 4 Stations.
- Award material procurement PO to A/E firms (Brooklawn & Hillsborough)
- Finalize Piping & Instrumentation Diagram (P&ID) drawings packages (Brooklawn & Hillsborough)
- Start Site Plan drawings packages (Brooklawn & Hillsborough)

B. Quantity of Work Completed to Date:

- Started Detailed Design Engineering for all 4 stations.
- Completed P&ID drawings packages (Brooklawn & Hillsborough)
- Started KDR drawings package review (Brooklawn & Hillsborough)
- Started Interconnect Agreement with gas pipeline operators (Brooklawn & Hillsborough)
- Completed Site Plan drawings package (Brooklawn)
- Started Site Plan drawings package (Hillsborough)

Metric 2 – Estimated Program and Subprogram Completion Dates

The estimated IAP project completion date, and estimated completion dates for each IAP sub-program and the Program as a whole.

PROGRAM

Program	Subprogram	Forecast In-Service	Timeline for Completion*
IAP	Electric & Gas	Jun-26	Dec-26

SUBPROGRAMS

Program	Subprogram	Forecast In-Service	Timeline for Completion*
Electric	Life Cycle Projects	Sep-25	Mar-26
Electric	26kV Oil Circuit Breaker Replacement	Jun-26	Dec-26
Electric	Lashed Cable	May-26	Nov-26
Electric	Open Wire to Spacer	Dec-25	Jun-26
Electric	Spacer Hardware	Dec-23	Jun-24
Electric	CUG Cable	Jun-26	Dec-26
Electric	Capacitor Bank Upgrades	Jun-26	Dec-26
Electric	Open Wire Secondary Upgrades	Dec-23	Jun-24
Electric	BUD Cable	Jun-26	Dec-26
Gas	M&R Stations	Oct-25	Jul-26

*** Timeline for Completion is defined by the completion date of project closeout report.**

ELECTRIC INSIDE PLANT

Electric Life Cycle Stations

Project	Forecast In-Service	Timeline for Completion	Updates	Expected Changes
Tonnelle Ave Substation	Jan-25	Jul-25		
40th Street Substation	Feb-25	Aug-25

Hanover M&R	Oct-25	Jul-26		

Metric 3 – Circuit Performance - SAIDI/SAIFI/CAIDI

This metric includes data for completed circuits involved in the Major and Non-Major events occurred in the 1st half of 2023, from January 1st, 2023 to June 30th, 2023.

A. Reports included for **Major events** in 1st half of 2023 –

No Major Events occurred in the reporting period.

B. Reports included for **Non-Major Events** in 1st half of 2023 –

M3.B.a Conventional Underground Cable Replacement.
M3.B.b Spacer Hardware Upgrades.
M3.B.c Lashed Cable Replacement.
M3.B.d Open Wire to Spacer.

Detailed tables for this metric are included at the end of this report, page 24 and onwards.

Metric 4 – Semi Annual and Program To-Date Forecast and Actual Costs with Variance

ELECTRIC INSIDE PLANT

Electric Life Cycle Stations

- Accelerated Recovery

Semi-Annual Performance (2023-1, January to June) **Program to Date (June, 2023)**

Similar Projects Comparable to IAP Subprograms

Actual capital expenditures made in the normal course of business on similar projects, identified by comparable IAP sub-program:

IAP Investment Category	Description	Applicable IAP Subprograms	Capital Spend on Comparable Non-IAP Subprograms
Hardening & Resilience	Harden infrastructure, thereby making it less susceptible to damage from major storm events, wind and vegetation contact. Strengthen the resiliency of the Company's delivery system.	* Electric Open Wire to Spacer * Electric Lashed Cable * Electric Spacer Hardware * Electric Open Wire Secondary	$ 4,446,037
Life Cycle	Reliability - LC replacements	* Electric Stations LC (4kV) Replacement * 26kV OCB Replacement * Capacitor Bank upgrades * Conventional Underground Cable replace * Buried Underground Cable replace * Gas M&R Station Modernization	$ 32,706,873
Total	**Capital Spend from July 2022 to June 2023**		**$ 37,152,910**

Detailed Tables for Metric 3 for Semi Annual Report 2023-1 – Non-Major Event Performance

Table M3.B.a – Conventional Underground (CUG) Cable Replacement

This report includes quarterly non-major event performance combining all events only for the circuits which are fully completed.

Blank cell indicates no outage for the circuit.
Note: The 0.00000 signifies there was an outage but the value is beyond 5 decimal place.

Direct Testimony
Of
Clifford Pardo
Vice-President of Tax and Assistant Controller
PSEG Services Corporation

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Clifford Pardo. My business address is 80 Park Plaza, Newark, New Jersey.

Q. By whom are you employed and in what capacity?

A. I am employed by PSEG Services Corporation as Vice-President of Tax and Assistant Controller. My professional credentials are attached as Schedule CP-1.

Q. What is the purpose of your testimony?

A. In this proceeding, I am testifying on behalf of Public Service Electric and Gas Company ("PSE&G," "Public Service," or "the Company"). The purpose of my testimony is to present and support tax expense, accumulated deferred income taxes ("ADIT"), modifications to the existing Tax Adjustment Credit ("TAC"), the consolidated tax ratemaking adjustment, and other tax issues arising in this proceeding. Specifically, my testimony is comprised of the following sections:

- Section I provides an introduction;
- Section II summarizes the impacts of the 2017 Tax Cuts and Jobs Act ("TCJA") and 2022 Inflation Reduction Act ("IRA"), and their impacts on this rate proceeding;
- Section III presents current and deferred tax expense and ADIT included in this test period;
- Section IV discusses modifications to the TAC; and

- Section V provides the consolidated tax ratemaking adjustment and presents a computation of that adjustment.

Q. Do you sponsor any schedules as part of your prepared testimony?

A. Yes. I sponsor the following schedules that were prepared or compiled under my direct supervision:

- Schedule CP-1 describes my professional qualifications and business experience;
- Schedule CP-2 details the computation of income tax expense for electric and gas for the test year;
- Schedule CP-3 details the computation of accumulated deferred income taxes for electric and gas for the test year;
- Schedule CP-4 details the computation of the estimated annual net Mixed Service Deduction and the Historic Mixed Service ADIT balance; and
- Confidential Schedule CP-5 details the computation of the CTA.

II. <u>IMPACT OF TCJA AND IRA</u>

A) TCJA

Q. Does TCJA have implications for this proceeding?

A. Yes. On December 22, 2017, the President signed into law a bill entitled "To provide for reconciliation pursuant to titles II and V of the concurrent resolution on the budget for fiscal year 2018", more commonly known as the "Tax Cuts and Jobs Act" or "TCJA." Below I describe the major provisions of TCJA and discuss their impacts on this proceeding.

Q. Please describe the implications to PSE&G of the reduction in the federal corporate income tax rate.

A. Effective January 1, 2018 the TCJA reduced the federal corporate income tax rate from 35% to 21%. This rate change had a number of implications, including:

- Reducing PSE&G's tax expense after 2017;
- Increasing PSE&G's operating income by lowering tax expense;
- Creating a portion of PSE&G's 2017 ADIT balance in excess of what is needed to offset future tax liabilities (excess deferred income taxes or "EDIT"); and
- Altering the after tax cost of debt as well as the revenue gross-up factor and the interest synchronization computation.

Q. What are deferred income taxes and how do they impact customers?

A. PSE&G, through the ratemaking process, charges customers current and deferred income tax expense. Current tax expense represents the tax expense expected to be paid to the government for that tax year. Deferred tax expense represents a future tax liability that will be paid when related temporary differences between book and taxable income reverse.

Q. Can you provide an example?

A. An example of such a temporary difference is the difference created by accelerated depreciation. In the case of accelerated depreciation, deductible tax depreciation exceeds book depreciation in the early portion of an asset's life, but then in the later portion of that asset's life, book depreciation exceeds tax depreciation. In total, the amount of depreciation is the same; just the timing is different. Deferred taxes spread the tax benefit of depreciation over the book life of the property, so that every dollar of book depreciation charged to customers carries

a tax benefit. This deferred tax also reduces rate base so that customers receive the benefit of the cost-free capital.

Q. How did the TCJA create excess deferred income taxes?

A. Deferred taxes are calculated using the tax rate in effect at the time the deduction is claimed. TCJA was enacted in 2017, and reduced that tax rate from 35% to 21% starting in 2018. Because the tax rate has permanently declined to 21%, when those timing differences reverse, the amount of tax owed will be computed at the new lower 21% rate, not 35%. As a result, a portion of PSE&G's December 31, 2017 ADIT balance was in excess of what is needed to offset future tax liabilities and thus must be returned to customers.

Q. Are there requirements on how the EDIT is returned to customers?

A. Yes, depending on the deduction that caused the ADIT balance. These excess deferred taxes fall into two categories: (1) those restricted by the normalization provisions of the TCJA (sometimes referred to as "protected" EDIT); and (2) those that are not (sometimes referred to as "unprotected" EDIT).

Q. How is the protected EDIT returned to customers?

A. The protected excess deferred taxes must be returned to customers using the Average Rate Assumption Method ("ARAM"). The ARAM provision provides for the reversal of EDIT on a vintage and class basis as the related timing differences reverse, using the weighted average tax rate at which deferred taxes were established.

Q. How is the unprotected EDIT returned to customers?

A. By way of contrast to the protected EDIT, the unprotected excess deferred taxes can be returned to customers over any reasonable period. As approved by the Board on October 29,

2018 at the conclusion of the Company's prior rate case, the Company has been refunding unprotected EDIT over an approximately five-year period through December 31, 2023[1], with a slight remaining balance to be refunded in 2024, in accordance with the IRS Private Letter Ruling ("PLR") discussed below.

Q. How does TCJA address accelerated and "bonus" depreciation?

A. While TCJA provides for 100% depreciation for capital expenditures beginning September 27, 2017, regulated utilities are not eligible for this 100% expensing. Beginning in 2018, only regular Modified Accelerated Cost Recovery System ("MACRS") depreciation may be claimed by regulated utilities.

Q. Does TCJA contain any other changes relevant to this case?

A. No.

B) IRA

Q. Does the Inflation Reduction Act of 2022 impact the current rate proceeding?

A. The IRA enacted a new 15% corporate alternative minimum tax ("CAMT") and made material changes to energy tax credit law. Since enactment, the U.S. Treasury has issued various proposed regulations and Notices that provide interim guidance regarding several provisions of the IRA. The Notices related to the CAMT state that Treasury anticipates issuing additional guidance along with proposed and final regulations. Many aspects of the IRA remain

[1] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of an Increase in Electric and Gas Rates and for Changes in Tariffs for Electric and Gas Service, B.P.U.N.J. No. 16 Electric and B.P.U.N.J. No. 16 Gas, and for Changes in Depreciation Rates, Pursuant to N.J.S.A. 48:2-18, N.J.S.A 48:2-21 and N.J.S.A. 48:2-21.1, and for Other Appropriate Relief*, BPU Docket Nos. ER18010029 & GR18010030; *I/M/O the New Jersey Board of Public Utilities' Consideration of the Tax Cuts and Jobs Act of 2017*; BPU Docket No. AX18010001; *I/M/O Public Service Electric and Gas Company for Approval of Revised Rates (Effective on an Interim Basis April 1, 2018) to Reflect the Reduction Under the Tax Cuts and Jobs Act of 2017*, BPU Docket No. ER18030231, Decision and Order Adopting Initial Decision and Stipulation (October 29, 2018) (the "2018 Rate Case Order") at 9-11.

unclear and in need of further guidance; therefore, the impact the IRA will have on PSE&G's financial statements and this proceeding is subject to continued evaluation and the issuance of additional authoritative guidance. The Company may propose an adjustment to the TAC or other mechanism to capture the impact of further U.S. Treasury guidance on the CAMT, if such guidance is applicable to PSE&G.

III. TAX EXPENSE AND ACCUMULATED DEFERRED INCOME TAXES

Q. Have you determined the appropriate income tax expense component of operating income for the filed test period?

A. Yes. I have computed a total income tax expense for the test period of $25 million for electric and a total income tax benefit of ($29) million for gas. This is comprised of a current tax benefit of ($8) million for electric and a current tax expense of $11 million for gas, and a deferred tax expense of $33 million for electric and a deferred tax benefit of $40 million for gas. The details of this determination are shown on Schedule CP-2, which shows current tax expense and significant components of deferred tax expense. I provided this tax expense to Mr. McFadden for inclusion in his Schedule MPM–28. The income tax expense includes a tax benefit for bad debt write offs, which is excluded in a pro forma adjustment in the testimony of Mr. McFadden, and is included in Schedule MPM-53.

Q. Did you prepare a schedule showing the balance of ADIT associated with utility plant?

A. Yes. It can be found at Schedule CP–3. In the schedule, I have broken utility-plant-related ADIT down into the following categories:

- ***Accelerated depreciation and other*** – includes the federal deferred taxes that either arise or reverse through depreciation deductions (including bonus depreciation) allowed pursuant to sections 167 and 168 of the Internal Revenue Code ("IRC").

- ***Safe Harbor Adjusted Repair Expense ("SHARE") deductions*** – includes federal deferred taxes associated with projects that are claimed as deductible repair expenses pursuant to IRC section 162 but are capital assets for financial reporting purposes. This deduction is described in more detail below.
- ***Mixed Service tax deduction*** – includes existing federal deferred taxes associated with projects that historically claimed a tax deduction for Mixed Service costs under IRC 162. This deduction is described in more detail below.
- ***NJ corporate business tax*** – includes all deferred taxes provided for the NJ Corporate Business Tax.

Mr. McFadden has reflected these deferred taxes as a rate base reduction in Schedule MPM–03.

SHARE Deduction

Q. What is a SHARE deduction?

A. The SHARE deduction is an acronym for the repair deductions discussed below.

Q. What are repair deductions?

A. On September 12, 2011, the IRS released Revenue Procedure 2011-43, which was later modified in Revenue Procedure 2014-16, detailing a safe harbor method for determining repair deductions for electric transmission and distribution property. Generally, for book and tax purposes, costs are either capitalized into the depreciable basis of an asset or currently expensed for book purposes and deducted for tax purposes. For tax purposes, costs associated with a unit of property are considered deductible repair expenses and not capitalized unless they are incurred for either a) betterment of the property, b) restoration of the property, or c) to adapt the unit of property to a new or different use as determined under the Revenue Procedure.

Q. How do the repair deduction rules apply?

A. These rules apply to all vintages of property and permit immediate expensing of all costs associated with projects considered a deductible repair expense pursuant to IRC section 162, resulting in a tax reduction in the year incurred, but are capital assets for financial reporting and ratemaking purposes. PSE&G has claimed enhanced repair deductions since 2010 for both its electric and gas distribution operations (referred to as a "SHARE deduction"). SHARE deductions are considered unprotected.

Q. Has the IRS provided additional guidance on the Gas SHARE deductions?

A. Yes. In April 2023, the Treasury released Revenue Procedure 2023-15 associated with determining the repair deduction for gas transmission and distribution property.

The impact, if any, of this Revenue Procedure is in process of being determined and possibly may require additional authoritative guidance. The Company reserves the right to propose an adjustment to the TAC to capture the impact of Revenue Procedure 2023-15 including any further guidance issued.

Q. How is the SHARE deduction returned to customers?

A. The SHARE deduction is returned to customers through the TAC in two ways: 1) amortization of the historic SHARE balance and 2) flow-back of the current net SHARE tax benefit. The historic SHARE was a component of the Company's ADIT in the 2018 base rate case. Per the Stipulation of Settlement approved by the Board in the 2018 Rate Case Order, the balance is being flowed-back to customers over a 10-year period, with one-third of the balance returned in the first five years and the two-thirds remaining balance returned in the remaining

five years.[2] The current SHARE is calculated as the on-going, annual SHARE tax deduction less the book depreciation associated with SHARE deductions multiplied by the federal tax rate. It is contemporaneously flowed back to PSE&G's customers.

Q. Is the SHARE deduction the same each year?

A. No. The SHARE deduction has the potential to significantly vary year-to-year based on the actual plant activity and mix of capital projects placed in service each year that qualifies as repair, which causes volatility in the SHARE deduction.

Mixed Service Deduction

Q. What is a Mixed Service deduction?

A. IRC section 263A governs which costs are capitalizable, deductible, or both, referred to in Treasury Regulation Section 1.263A-1(e)(4)(ii)(C) as "Mixed Service costs." That Treasury regulation defines Mixed Service costs as service costs that are partially allocable to production or resale activities (capitalizable) and partially allocable to nonproduction or non-resale activities (deductible). Mixed Service costs are typically thought of as general and administrative costs.

Q. Can you provide an example of a Mixed Service deduction?

A. A company's personnel department may incur costs to recruit employees engaged in the production of self-constructed assets (capitalizable) as well as costs to recruit employees engaged in nonproduction activities (deductible).

[2] 2018 Rate Case Order at 9.

Q. How does the Mixed Service deduction impact ADIT?

A. Treasury Regulation section 1.263A applies to all vintages of property and permits immediate deduction of all costs associated with projects pursuant to IRC section 162, resulting in a tax deduction in the year incurred, but are capital assets for financial reporting and ratemaking purposes. ADIT results from the timing difference between financial reporting, which is depreciated over the life of the asset, and tax reporting, which is immediately deducted. Mixed Service deductions are unprotected and not subject to the tax normalization rules.

Q. Is there more than one directive on how to calculate the Mixed Service deduction?

A. Yes. The IRS has issued a number of Industry Director Directives ("IDDs") related to the computation of the Mixed Service deduction. Generally, the regulated utility industry follows IDD No. 5 (LMSB 04-0809-033, 2009), which is based on the simplified service cost method.

Q. Are you proposing a change in the regulatory treatment of the Mixed Service deduction in this proceeding?

A. Yes. As described below, the Company proposes to return both the historic and current Mixed Service deduction to customers through the TAC in the same manner as done for the SHARE.

Q. Do you have any workpapers or schedules supporting your current Mixed Service forecast?

A. Yes. See Schedule CP-4 for the calculation.

Deferred vs Flow-thru Accounting

Q. What is deferred tax accounting and how does it differ from flow-thru accounting?

A. Generally Accepted Accounting Principles ("GAAP"), codified as ASC 740, require comprehensive inter-period tax allocation for all temporary differences between book and tax accounting. Simply stated, a temporary difference is an item of income or expense, for which the difference in basis or timing of recognition in income differs between tax purposes and financial reporting purposes. When a temporary difference is reflected in the computation of taxable income in a different period than it is for financial reporting purposes, there is an impact on the timing of taxation, and GAAP requires that a deferred tax expense or benefit be recorded on the income statement to reflect the future reversal of that temporary difference. A deferred tax expense results in an increase in ADIT liabilities on the balance sheet, and the liability reverses as the Company repays the temporary benefit to the government in the form of higher tax payments in the future. This is what I refer to as deferred tax accounting.

Q. Can you describe flow-through accounting?

A. To state it simply, flow-through accounting puts the utility on a tax return basis (cash basis) for tax recovery in the ratemaking process. Tax expense or benefit of the particular item will flow to customers in the year in which the taxes are reflected in the tax return. Deferred tax accounting, in contrast, matches the tax impact of an item of expense or income with the recovery of that item from customers.

Q. Is either the flow-through or deferred tax accounting method required?

A. Neither method is required in setting rates, subject to two exceptions.

First, for ratemaking purposes, when the tax normalization rules apply, deferred tax accounting is required. Normalization rules apply to deductions associated with accelerated depreciation claimed pursuant to IRC sections 167 and 168. The deduction for accelerated depreciation will be forfeited if the normalization rules are violated by flowing back tax depreciation benefits to customers too quickly. The normalization rules do not apply to deductions claimed under any other section of the Code, such as the SHARE and Mixed Service deductions that are claimed under IRC section 162.

The second exception is that N.J.S.A. 48:2-21.34 requires deferred tax accounting in setting utility rates for all temporary differences used in computing New Jersey ("NJ") State income tax. Therefore, no ADIT computed at the NJ rate may be flowed through, and instead, normalization would be required for the NJ State income tax portion of the SHARE and Mixed Service deductions.

IV. TAX ADJUSTMENT CREDIT

Q. Can you please describe the TAC?

A. The prior base rate proceeding established a separate Electric and Gas TAC ("ETAC" and "GTAC") as set forth on Attachment C of the Stipulation of Settlement approved in the 2018 Rate Case Order. The 2018 Rate Case Order approved the following eight components of the TAC:

- A one-time refund of the excess income tax recovery from January - March 2018 was issued during the two-month period November and December 2018 and included interest based upon the Company's interest rate obtained on its commercial paper and/or bank credit lines utilized in the preceding month;[3]

[3] These amounts have been flowed back to customers and has no impact on the current rate proceeding.

- Refund of the protected excess deferred tax balance, which is flowed back to customers under the ARAM or any other method as required by the IRS;
- Refund of the unprotected excess deferred tax balance over an approximately five (5) year period through December 31, 2023, with the annual amortization as shown in Attachment C of the Stipulation;
- Refund of the historic SHARE balance as of October 31, 2018 over a 10 year period, with one-third of the balance returned over the first approximately 5 years through December 31, 2023, and the balance returned over the remaining 5 year period ending December 31, 2028;
- Return on the increase in rate base at the Company's after-tax WACC from the flow-through of rate base related excess deferred taxes (comprised of all protected excess deferred taxes, the historic SHARE, and a portion of the unprotected excess deferred taxes as shown in Attachment C of the Stipulation);
- Payment of interest at the Company's after-tax WACC on the balance of the non-rate base related excess deferred taxes until fully refunded over the approximately 5-year period;
- Flow-through of the estimated current period SHARE deduction, plus or minus true-ups from prior periods, calculated as the actual SHARE tax deduction less all associated SHARE book depreciation, multiplied by the Federal tax rate. Any true ups from prior periods will be flowed back to customers in the next appropriate period. Note, this adjustment is inclusive of expenses that made up the ADR repair allowance deduction previously in base rates such that all repair related flow through will be done through the TAC; and

- A revenue gross-up of the net tax flow-through.

The mechanics of the TAC are discussed in the Direct Testimony of Mr. Steven Swetz. Additionally, Attachment C of the Stipulation of Settlement adopted by the Board in the 2018 Rate Case Order set forth the EDIT and SHARE tax benefit balances to be flowed back to customers monthly for the period Jan 2018 through December 2019 and the annual flow back of the protected and unprotected excess deferred taxes for years 2020 through 2029.

Q. Have the balances of the Protected and Unprotected Excess ADIT changed since the 2018 Rate Case Order?

A. Yes. The balances for the Protected and Unprotected Excess ADIT, which were approved to be refunded in the 2018 Rate Case Order, changed for four reasons:

1) A reclassification between the protected and unprotected balance;

2) An ADIT adjustment as a result of the 2017 federal and state return to accruals ("RTA");

3) The result of the IRS ruling on the Company's PLR requests with regard to a change in accounting method and the treatment of cost of removal expenditures, which is discussed in more detail below; and

4) An IRS audit settlement of tax years prior to 2018.

The first two adjustments were included in the Company's 2019 TAC filing and subsequently adjusted to reflect the immaterial impact of the federal benefit of state taxes that resulted from the 2017 state return to accrual.[4] The IRS guidance on the Company's PLR request was not available at the time of the Company's 2019 TAC filing as it was issued in April 2020. The

[4] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of Changes in Its Electric Tax Adjustment Credit and Gas Tax Adjustment Credit ("2019 TAC Filing")*, BPU Docket Nos. ER19091302 and GR19091303 (filed September 26, 2019).

Company incorporated the results of the PLR requests into the final approved TAC rates approved by the Board on July 16, 2020. There has been no change to the Company's historic SHARE balance. The Company has settled its 2011 through 2016 tax return audit with the IRS and reflected any changes to the excess deferred taxes as a result of the settlement in the fourth quarter of 2020. These impacts were included in the 2021 TAC filing.[5]

Q. Do the first two adjustments (reclassification and 2017 RTA) approved in the 2019 TAC filing affect the current filing?

A. Yes. While the adjustments to the balances occurred in 2018, the relative amortization related to these adjustments are being amortized through 2023.

Q. Please explain what are the PLR reclassifications between protected and unprotected deferred income taxes?

A. In compliance with the Company's Base Rate Case Order, PSE&G sought a PLR from the IRS that would give guidance as to whether excess deferred income tax associated with accounting changes to repair deductions and mixed service costs are protected in nature and subject to normalization rules. In addition, PSE&G also required a PLR from the IRS regarding its post-1981 cost or removal and whether amounts were subject to normalization rules and if it is to be treated as a separate temporary difference or part of the overall depreciation temporary difference.

Q. Did PSE&G obtain those private letter rulings?

A. Yes. In April 2020, the IRS issued a ruling to PSE&G that held both the deficient deferred taxes related to COR and the excess deferred taxes associated with accounting method

[5] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of Changes in its Electric Tax Adjustment Credit and Gas Tax Adjustment Credit ("2021 TAC Filing")*, BPU Docket Nos. ER21101201 & GR21101202 (filed October 29, 2021) at Attachment 1 at 10.

changes related to repair deductions and the capitalization of mixed service costs are unprotected and not subject to the tax normalization rules.

Q. What excess amounts will be amortized pursuant to those PLRs?

A. Pursuant to the guidance in the PLR, PSE&G is flowing back $75 million in total net pre-tax credits to customers. Of that amount, approximately $41 million and $34 million in excess deferred income taxes will be amortized to electric and gas customers, respectfully, through 2024.

Q. Are these amounts currently being amortized back to customers?

A. Yes. On July 16, 2020, the Board approved PSE&G's Updated 2019 TAC filing including the reclassification pursuant to the IRS guidance that these deficient deferred taxes related to COR and the excess deferred taxes are not subject to the tax normalization rules. As such, these amounts have been reclassified and are being amortized through the TAC effective July 16, 2020, as approved by the Board.

Q. What are the benefits associated with the TAC?

A. There are several benefits associated with the TAC:

- Utilizing the TAC allows for an uneven method of amortization, which the Company could not do in a traditional base rate amortization without an annual base rate case.
- It provides a mechanism to stop the amortization of historical ADIT once the repair-related ADIT is fully returned to customers, to avoid possible IRS normalization violations.
    - If the Company were to over-amortize the SHARE-deduction-related ADIT balance, the excess amortization arguably would come from the depreciation-

related ADIT, which is protected by the normalization rules. Reversing that deferred tax would result in a normalization violation and the possibility of significant penalties. Use of the TAC eliminates that risk.

- The TAC provides a mechanism that will permit the recovery of IRS audit adjustments, changes, or subsequent clarifications to tax law, or other major tax changes, if any.
    - For example, while the IRS has not challenged the Company's SHARE deductions, tax deductions of this magnitude are routinely scrutinized. Given the size of these deductions and the IRS's policy of auditing multiple years at a time, a final disallowance could be material. Because the tax benefit of any deductions will have already been passed to customers, any IRS disallowance and interest thereon would need to be recovered from customers. The TAC will provide the mechanism to ensure timely recovery.

Q. What is the status of the Excess Deferred Tax balance to be flowed back through the TAC?

A. The reduction in the federal tax rate generated a total of $1 billion of excess deferred taxes. Through the end of 2022, the balance remaining of protected EDIT to be flowed back to customers is approximately $882 million and unprotected EDIT is approximately $203 million. For the test period, the flow back to customers is included in this filing.

Q. Are there any adjustments to the TAC as originally approved in the 2018 rate case?

A. Yes. PSE&G proposes the following adjustments, which are described in more detail later in my testimony:

1) In addition to continuing to flow back the benefit of the historic SHARE deduction, the Company proposes to flow back to customers the net federal tax benefit associated with the historical Mixed Service ADIT balance over approximately five years.

2) The Company proposes to add the current Mixed Service deduction net benefit to the current SHARE deduction net benefit already included in the TAC, but both at a pre-determined, fixed annual amount, with any excess to be flowed back to customers in a subsequent rate case; and

3) To better match the seasonal flow of Company pre-tax income, the Company began to amortize the monthly flow back of EDIT and SHARE on a seasonal basis in the 2023 TAC filing to match pre-tax income as described in the 2023 TAC cost recovery proceeding.[6] In this proceeding, the Company is aligning the return calculation with the seasonal amortization methodology.

I discuss each proposed change below.

1) Historic Mixed Service

Q. Why are you proposing to flow back the historic Mixed Service deduction through the TAC?

A. The historic Mixed Service deduction is an unprotected deferred tax liability that can be flowed back to customers. This is similar to the current mechanism to flow back the historic SHARE to customers with the exception that it would be over an approximate three-year period instead of 10 years as approved in the last rate case for the historic SHARE. The historic Mixed

[6] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of Changes in Its Electric Tax Adjustment Credit and Gas Tax Adjustment Credit ("2023 TAC Filing")*, BPU Docket Nos. ER23090634 and GR23090635 (filed September 1, 2023) (the "2023 TAC Filing").

Service balance is part of ADIT and reducing the Company's rate base. As the tax benefit is flowed back to customers, the ADIT balance declines and the Company's rate base increases. In the same manner as approved for the historic SHARE, the Company can refund this tax benefit to customers on an accelerated basis and earn a return on the increased rate base as a result of the refunds. The TAC allows for the accelerated refund of the Mixed Service net tax benefit while earning its allowed return as its rate base increases. The projected Mixed Service historic ADIT balance as of August 31, 2024 is approximately $366 million, and grossed up to revenues would represent a benefit to customers of $509 million. See Schedule CP-4 for the historic Mixed Service deduction that the Company proposes to be flowed through to customers through the TAC.

2) Annual SHARE and Mixed Service Deduction

Q. Are you proposing to flow back the annual Mixed Service deduction to customers as well?

A. Yes. As described below, the Company proposes that a fixed annual flow back amount be refunded to customers for both the annual SHARE and Mixed Service deductions.

Q. What is the annual Mixed Service and SHARE flow back?

A. The annual SHARE flow back is the annual Federal repair tax deduction less the associated book depreciation multiplied by the federal tax rate. Likewise, the annual Mixed Service flow back is the annual federal Mixed Service tax deduction less the associated book depreciation multiplied by the federal tax rate.

Q. Can you please discuss the proposal to limit the flow-back of the annual net SHARE and Mixed Service deductions?

A. To ensure that PSE&G customers receive the full benefit of these deductions while minimizing fluctuations in Distribution Customers' bills, the Company proposes to flow back a fixed annual benefit of $38 million and $18 million related to the annual SHARE and Mixed Service deduction, respectively, or a combined impact of $56 million. The actual SHARE and Mixed Service deductions will continue to be calculated and tracked annually. To the extent the actual benefit is higher than the proposed flow back amount, the excess would be added to the ADIT balance and flowed back to customers in a subsequent rate case.

Q. What is the benefit of this approach to limit the flow back amounts?

A. A fixed flow back amount will reduce the rate volatility and revenue requirement swings currently occurring in the existing TAC. The Current SHARE fluctuates annually and has seen significant swings, typically recorded in December. In addition, deferring the difference between the actual and proposed flow back amount can increase ADIT and provide an additional unprotected balance to be refunded to customers in a future rate case.

Q. Can you provide a simple example of how the deferral will work?

A. Yes. Assume this proposal is accepted and allows for a net SHARE deduction of $100 be flowed back to customers. However, the actual benefit is $150. The $50 additional benefit would be added to the existing ADIT balance, reduce rate-base, and be flowed back to customers in a subsequent rate case.

3) Monthly Amortization Pattern

Q. Can you please describe why the monthly amortization pattern of EDIT and SHARE flowback has changed and the impact to the return calculation?

A. As described in the Company's 2023 TAC Filing, the Company has changed the monthly amortization pattern to reflect the seasonality of pre-tax income. Historically, approximately 33% of the Company's revenue is generated in the first quarter each year. However, the tax benefits from flowing back the EDIT and SHARE were amortized on a straight-line basis, which caused a monthly mismatch. As a result, in 2023 the Company changed the monthly amortization of the EDIT and SHARE flowback to follow the seasonal pattern as the Company generates pre-tax income. The full-year total to be flowed to customers is not impacted. For the impact to the return calculation, see Schedule SS-ETAC-1E for electric and Schedule SS-GTAC-1G for gas in the Direct Testimony of Mr. Swetz.

Revised TAC

Q. Has the TAC been modified to reflect all of the changes you describe above?

A. Yes. Please see Schedule SS-ETAC-1E and Schedule SS-GTAC-1G of Mr. Swetz's testimony for the updated TAC reflecting:

1) The continued refund of the protected EDIT under ARAM;

2) The continued refund of the Historic SHARE (increased to reflect 2/3 of the October 31, 2018, balance as approved in the 2018 base rate case;

3) The new flow back of the Historic Mixed Service Deduction proposed to be added in this proceeding;

4) The return on the flow backs as they are returned to customers, calculated in the same manner as approved in the 2018 base rate case; and

5) The fixed flowback of the combined Current SHARE and Current Mixed Service deductions to account for the forecasted future deductions.

V. CONSOLIDATED TAX ADJUSTMENT

Q. What is a Consolidated Tax Adjustment?

A. To state it simply, a Consolidated Tax Adjustment ("CTA") is a ratemaking adjustment designed to pass some or all the benefit of tax savings generated by nonregulated subsidiaries of a consolidated return filing group to the regulated affiliate.

Q. What is the Board's policy regarding CTAs?

A. On January 23, 2014, the Board issued an order opening Docket EO12121072, a generic proceeding to review the applicability and computation of the CTA. On November 22, 2014, the Board issued an order ("November 22 Order") in that docket setting out key computational requirements with respect to the CTA. On December 17, 2014, the Board reaffirmed the January 2014 Order. The Board found that it is appropriate to include a Consolidated Tax Adjustment in utility base rate filings and found that the current CTA policy shall remain in effect with the following modifications:

1) The review period for the calculation shall be for five calendar years including any complete year that is included in the test year;
2) The calculated tax adjustment based on that review period shall be allocated so that the revenue requirement of the company is reduced by 100% of the adjustment; and
3) Transmission assets of the EDCs would not be included in the calculation of the CTA.

Q. Have you included a computation of the CTA that is consistent with Board Order?

A. Yes I have. In Confidential Schedule CP–5, I have provided the detailed computation using the approved Board Order. The resulting CTA reduces rate base by approximately $3 million for electric and $0 for gas. These reductions have been considered in this rate

proceeding. Mr. McFadden has included this amount in rate base as shown in Schedule MPM–03.

Q. Does this conclude your testimony at this time?

A. Yes, it does.

CREDENTIALS
OF
CLIFFORD PARDO
VICE-PRESIDENT OF TAX AND ASSISTANT CONTROLLER
PSEG SERVICES COMPANY

EDUCATIONAL BACKGROUND

In 1987, I graduated from Pace University with a Bachelors of Arts degree in Accounting. In 1992, I earned a Master of Science degree in Taxation from Baruch College. I am also a licensed Certified Public Accountant in the State of Maryland.

WORK EXPERIENCE

From 1995 through 1999, I was employed by J.M. Huber as Director of Tax and Treasury Services. In that position, I was responsible for the world-wide tax and treasury functions. I commenced employment with Public Service Enterprise Group Inc. ("PSEG") in 2000, excluding a two-year break in service between 2007 and 2009, where I am currently employed. From 2000 through 2007, I was the Director of Tax Planning (International Division). My responsibilities as the Director of Tax Planning centered on U.S. and international tax aspects of the Global International Division. In 2010, I rejoined PSEG as the Tax Director and was subsequently promoted to Senior Tax Director. During this time my responsibilities included overseeing the tax research and planning, tax accounting and tax forecasting groups. On January 1, 2018 I was promoted to my current position of Vice President of Tax and Assistant Controller and am responsible for all tax matters for the consolidated PSEG organization.

For completeness, between 2007 and 2008 I was employed by John Wiley & Sons, Inc., as Tax Director where I was responsible for all tax matters, and from 2008 through 2009, I was employed at AES Corporation, as Managing Director – International Tax Planning where I oversaw the international tax group.

I have prepared testimony and supporting data for PSE&G's 2018 electric and gas base rate case filing, filed January 12, 2018, addressing tax aspects of that proceeding as well as many other of PSE&G's filings such as the TAC and Solar 4All filings.

I am also an active participant in Edison Electric Institute Taxation Committee.

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
ANN E. BULKLEY
PRINCIPAL, THE BRATTLE GROUP

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Ann E. Bulkley. My business address is One Beacon Street, Suite 2600, Boston, Massachusetts 02108. I am employed by The Brattle Group ("Brattle") as a Principal.

Q. On whose behalf are you submitting this Prepared Direct Testimony?

A. I am submitting this testimony before the New Jersey Board of Public Utilities ("BPU" or the "Board") on behalf of Public Service Electric and Gas Company ("Public Service" or "the Company"), a wholly-owned subsidiary of Public Service Enterprise Group, Inc. ("PSEG").

Q. Please describe your education and experience.

A. I hold a Bachelor's degree in Economics and Finance from Simmons College and a Master's degree in Economics from Boston University, with more than 25 years of experience consulting to the energy industry. I have advised numerous energy and utility clients on a wide range of financial and economic issues with primary concentrations in valuation and utility rate matters. Many of these assignments have included the determination of the cost of capital for valuation and ratemaking purposes. I have included my resume and a summary of testimony that I have filed in other proceedings as Schedule AEB-1.

Q. Please describe the purpose of your testimony.

A. The purpose of my Direct Testimony is to present evidence and provide a recommendation regarding the appropriate return on equity ("ROE") for the Company and to assess the reasonableness of its proposed capital structure for ratemaking purposes.

Q. Are you sponsoring any schedules in support of your Direct Testimony?

A. Yes. My analysis and recommendations are supported by the data presented in Schedule AEB-2 through Schedule AEB-13, which were prepared by me or under my direction.

Q. Please provide a brief overview of the analyses that led to your ROE recommendation.

A. I estimated the Company's Cost of Equity ("COE") by applying several traditional COE estimation methodologies to a proxy group of comparable utilities, including Discounted Cash Flow ("DCF"), Capital Asset Pricing Model ("CAPM"), Empirical CAPM ("ECAPM"), and Bond Yield Risk Premium ("BYRP" or "Risk Premium") analysis. My recommendation also takes into consideration: (1) the Company's actual and anticipated capital expenditure requirements, and (2) the Company's regulatory risk as compared with the proxy group. Finally, I considered the Company's capital structure as compared with the capital structures of the proxy companies.[1] While I did not make any specific adjustments to the ROE recommendation for any of these factors individually, I did take them into consideration in aggregate when determining where the Company's ROE falls within the range of analytical results.

[1] The selection and purpose of developing a group of comparable companies will be discussed in detail in Section V of my Direct Testimony.

Q. How is the remainder of your Direct Testimony organized?

A. Section II provides a summary of my analyses and conclusions. Section III reviews the regulatory guidelines pertinent to the development of the cost of capital. Section IV discusses current and projected capital market conditions and the effect of those conditions on the cost of equity. Section V explains the selection of a proxy group of combination electric and natural gas distribution utilities. Section VI describes the analyses and analytical basis for the recommendation of an appropriate ROE for Public Service. Section VII provides a discussion of specific regulatory, business and financial risks that directly affect the ROE to be authorized for the Company in this case. Section VIII addresses the Company's capital structure as compared with the capital structures of the utility operating company subsidiaries of the proxy group companies. Section IX presents my conclusions and recommendations.

II. SUMMARY OF ANALYSIS AND CONCLUSIONS

Q. Please summarize the key factors considered in your analyses and upon which you base your recommended ROE.

A. The key factors that I considered in my cost of equity analyses and recommended ROE for the Company in this proceeding are:

- The United States Supreme Court's *Hope* and *Bluefield* decisions[2] established the standards for determining a fair and reasonable authorized ROE for public utilities, including consistency of the allowed return with the returns of other businesses having similar risk, adequacy of the return to provide access to capital and support credit quality, and the requirement that the result lead to just and reasonable rates.
- The effect of current and projected capital market conditions on ROE estimation models and on investors' return requirements.
- The results of several analytical approaches that provide estimates of the Company's cost of equity. Because the Company's required COE should be a forward-looking estimate, these analyses rely on forward-looking inputs and assumptions (e.g., projected analyst growth rates in the DCF model, forecasted risk-free rate and market risk premium in the CAPM analysis)

[2] *Hope*, 320 U.S. 591 (1944); *Bluefield*, 262 U.S. 679 (1923).

- The Company's regulatory, business, financial and regulatory risks relative to the proxy group of comparable companies, and the implications of those risks in determining an appropriate ROE for the Company over the period during which rates will be in effect.

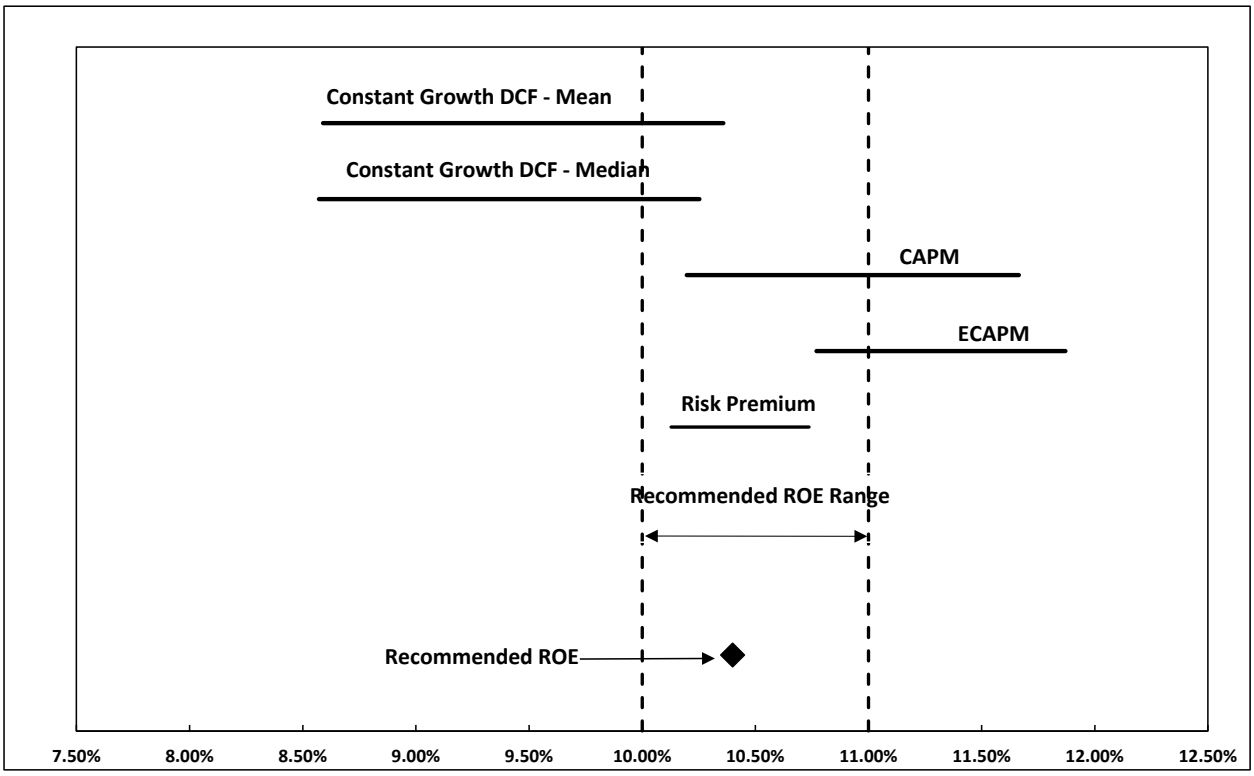
Q. Please explain how you considered those factors.

A. I relied on the range of results produced by the Constant Growth DCF model, the CAPM and ECAPM, and a Risk Premium analysis. As shown in Figure 1, these COE estimation models produce a wide range of results. My conclusion as to the appropriate ROE for Public Service within that range of results is based on the Company's business and financial risk relative to the proxy group and my assessment of market conditions. Although the companies in my proxy group are generally comparable to Public Service, each company is unique, and no two companies have the exact same business and financial risk profiles. Accordingly, I considered the Company's business, financial and regulatory risk in aggregate relative to that of the proxy group companies when determining where the Company's ROE should fall within the reasonable range of analytical results to appropriately account for any residual differences in risk.

Q. Please summarize the results of the COE estimation models that you considered to establish the range of the COE for Public Service.

A. Figure 1 summarizes the range of results produced by the Constant Growth DCF, CAPM, ECAPM, and Bond Yield Risk Premium analyses.

Figure 1: Summary of Cost of Equity Analytical Results



As shown in Figure 1 (and in Schedule AEB-2), the range of results produced by the COE estimation models is wide. While it is common to consider multiple models to estimate the cost of equity, it is particularly important when the range of results varies considerably across methodologies.

Q. Are prospective capital market conditions expected to affect the results of the cost of equity for Public Service during the period in which the rates established in this proceeding will be in effect?

A. Yes. Capital market conditions are expected to affect the results of the cost of equity estimation models. Specifically:

- Inflation is expected to persist over the near-term, which increases the operating risk of the utility during the period in which rates will be in effect.
- Long-term interest rates have increased substantially in the past year and are expected to remain relatively high at least over the next year in response to inflation.
- Over the past year, utilities have underperformed the broader market. For example, between January 1, 2023 and November 6, 2023, the S&P 500 Utilities Index

declined by 12.48 percent. During the same period, the S&P 500 Index increased by 13.71 percent. It is reasonable to expect this relationship to continue, as interest rates remain high or increase and investors have the option to invest in lower risk investments at similar returns offered on utility equity.

- Since utility dividend yields are less attractive than the risk-free rates of government bonds, and interest rates are expected to remain near current levels over the next year, it is likely that utility share prices will continue to decline.
- Similarly, equity analysts have noted the increased risk for the utility sector as a result of rising interest rates and expect the sector to underperform over the near-term.
- A decline in utility stock prices will increase the dividend yields and thus, all else equal, the cost of equity estimates produced by the DCF model.
- Consequently, the results of the DCF model, which relies on current utility share prices, is likely to understate the cost of equity during the period that the Company's rates will be in effect.
- Furthermore, expected market conditions warrant consideration of forward-looking cost of equity estimation models such as the CAPM and ECAPM, which, rely on interest rates as a direct input into the models and thus may better reflect the market conditions expected during the period that the Company's rates will be in effect.
- Rating agencies have cited increased risk in the utility sector due to increased interest rates, inflation and elevated capital expenditures.

It is appropriate to consider all of these factors when estimating a reasonable range of the investor-required cost of equity and the recommended ROE for Public Service.

Q. What is your conclusion regarding the appropriate authorized ROE for Public Service in this proceeding?

A. Based on the analytical results presented in Figure 1, my assessment of current and anticipated capital market conditions, and the Company's business, financial and regulatory risk relative to proxy group companies, I conclude that a ROE in the range of 10.00 percent to 11.00 percent is reasonable. Considering underlying market conditions and the business, financial and regulatory risk factors facing Public Service, including the Company's significant capital expenditures, the Company's requested ROE of 10.40 percent is conservative.

Q. Please summarize your analysis of the appropriate ratemaking capital structure for the Company.

A. Based on the analysis presented in Section VIII of my testimony, I conclude that Public Service's proposed 55.50 percent common equity ratio is reasonable. To determine if the Company's requested capital structure was reasonable, I reviewed the capital structures of the utility subsidiaries of the proxy companies. As shown in Schedule AEB-13, the results of that analysis demonstrate that the eight quarter (i.e., Q3/2021 Q2/2023) average equity ratios for the utility operating companies of the proxy group range from 47.21 percent to 66.21 percent. Comparing the recommended equity ratio to the proxy group demonstrates that the Company's requested equity ratio is well within the range of equity ratios for the utility operating subsidiaries of the proxy group companies.

III. REGULATORY GUIDELINES

Q. Please describe the guiding principles to be used in establishing the cost of equity for a regulated utility.

A. The United States Supreme Court's precedent-setting *Hope and Bluefield* cases established the standards for determining the fairness or reasonableness of a utility's allowed ROE. Among the standards established by the Court in those cases are: (1) consistency with other businesses having similar or comparable risks; (2) adequacy of the return to support credit quality and access to capital; and (3) the principle that the result reached, as opposed to the methodology employed, is the controlling factor in arriving at just and reasonable rates.[3]

[3] *Hope*, 320 U.S. 591 (1944); *Bluefield*, 262 U.S. 679 (1923).

Q. Has the Board provided similar guidance in establishing the appropriate return on common equity?

A. Yes. Section 48:2-21.25 of the 2022 New Jersey Revised Statutes states that a "Base rate case" is defined as a means of "determining the level of revenues necessary to afford the public utility an opportunity to earn a fair and reasonable rate of return on prudently incurred capital investment in the public utility's rate base."[4] Furthermore, in its decision in Docket No. ER12111052 for Jersey Central Power and Light Company ("JCP&L"), the Board noted the following:

> it is incumbent upon this Board to define a fair rate of return for JCP&L commensurate with risks faced by similar companies, sufficient to attract capital and maintain the financial integrity of the enterprise. As the New Jersey Supreme Court has recognized, a privately owned public utility is a complex mechanism that exists to serve a public need but to do so it must have investor appeal. It must be allowed a reasonable return on its investment so that it may have borrowing power at normal business rates to finance its day-to-day operations. See Daaleman v. Elizabethtown Gas Co., 77 N.J. 267, 272 (1978).[5]

Q. Why is it important for a utility to be allowed the opportunity to earn an ROE that is adequate to attract capital at reasonable terms?

A. An ROE that is adequate to attract capital at reasonable terms enables the Company to continue to provide safe, reliable electric and natural gas service while maintaining its financial integrity. That return should be commensurate with returns expected elsewhere in the market for investments of equivalent risk. If it is not, debt and equity investors will seek alternative investment opportunities for which the expected return reflects the perceived risks, thereby inhibiting the Company's ability to attract capital at reasonable cost.

---

[4] 2022 New Jersey Revised Statutes, Section 48:2-21.25.

[5] BPU Docket No. ER12111052, OAL Docket No. PUC16310-12, Agenda Date March 12, 2015, at 71.

Q. Is a utility's ability to attract capital also affected by the ROEs that are authorized for other utilities?

A. Yes. Utilities compete directly for capital with other investments of similar risk, which include other natural gas and electric utilities. Therefore, the ROE awarded to a utility sends an important signal to investors regarding whether there is regulatory support for financial integrity, dividends, growth, and fair compensation for business and financial risk. The cost of capital represents an opportunity cost to investors. If higher returns are available for other investments of comparable risk, investors have an incentive to direct their capital to those investments. Thus, an authorized ROE that is not in line with authorized ROEs for other natural gas and electric utilities, on a risk adjusted basis, can inhibit the utility's ability to attract capital for investment in New Jersey.

Q. Is the regulatory framework and the authorized ROE and equity ratio important to the financial community?

A. Yes. The regulatory framework is one of the most important factors in debt and equity investors' assessments of risk. Specifically regarding debt investors, credit rating agencies consider the authorized ROE and equity ratio for regulated utilities to be very important for two reasons: (1) they help determine the cash flows and credit metrics of the regulated utility; and (2) they provide an indication of the degree of regulatory support for credit quality in the jurisdiction. To the extent that the authorized returns in a jurisdiction are lower than the returns that have been authorized more broadly, credit rating agencies will consider this in the overall risk assessment of the regulatory jurisdiction in which the company operates. Not only do credit ratings affect the overall cost of borrowing, they also act as a signal to equity investors about the risk of investing in the equity of a company.

Q. Are you aware of any utilities that have experienced either a credit rating downgrade or negative market response related to the financial effects of a rate case decision?

A. Yes. ALLETE, Inc.[6], CenterPoint Energy Houston Electric[7], and Pinnacle West Capital Corporation ("PNW")[8] each received credit rating downgrades following a rate case decision for reasons that included a below average authorized ROE. In the case of PNW, the market had a strong negative response to the rate case decision for its operating subsidiary, Arizona Public Service Company ("APS"), which included an 8.70 percent ROE determination.[9]

Q. What is the standard for setting the ROE in any jurisdiction?

A. The stand-alone ratemaking principle is the foundation of jurisdictional ratemaking. This principle requires that the rates that are charged in any operating jurisdiction be for the costs incurred in that jurisdiction. The stand-alone ratemaking principle ensures that customers in each jurisdiction only pay for the costs of the service provided in that jurisdiction, which is not influenced by the business operations in other operating companies. In order to maintain this principle, the COE analysis is performed for an individual operating company as a stand-alone entity. As such, I have evaluated the investor-required return for Public Service's electric and natural gas operations.

---

6 Moody's Investors Service, "Credit Opinion: ALLETE, Inc. Update following downgrade," at 3 (April 3, 2019).

7 FitchRatings, "Fitch Downgrades CenterPoint Energy Houston Electric to BBB+; Affirms CNP; Outlooks Negative," February 19, 2020.

8 S&P Capital IQ Pro; FitchRatings, "Fitch Downgrades Pinnacle West Capital & Arizona Public Service to 'BBB+'; Outlooks Remain Negative," October 12, 2021; and Moody's Investors Service, "Rating Actions: Moody's downgrades Pinnacle West to Baa1 and Arizona Public Service to A3; outlook negative," (Nov. 17, 2021).

9 S&P Global Market Intelligence, "Pinnacle West shares tumble after regulators slash returns in rate case," October 7, 2021.

Q. What are your conclusions regarding regulatory guidelines?

A. The ratemaking process is premised on the principle that, in order for investors and companies to commit the capital needed to provide safe and reliable utility services, a utility must have a reasonable opportunity to recover the return of, and the market-required return on, its invested capital. Accordingly, the Board's order in this proceeding should establish rates that provide the Company with a reasonable opportunity to earn a ROE that is: (1) adequate to attract capital at reasonable terms; (2) sufficient to ensure its financial integrity; and (3) commensurate with returns on investments in enterprises with similar risk. It is important for the ROE authorized in this proceeding to take into consideration current and projected capital market conditions, as well as investors' expectations and requirements for both risks and returns. Because utility operations are capital-intensive, regulatory decisions should enable the utility to attract capital at reasonable terms under a variety of economic and financial market conditions. Providing the opportunity to earn a market-based cost of capital supports the financial integrity of the Company, which is in the interest of both customers and shareholders.

IV. CAPITAL MARKET CONDITIONS

Q. Why is it important to analyze capital market conditions?

A. The COE estimation models rely on market data that are either specific to the proxy group, in the case of the DCF model, or to the expectations of market risk, in the case of the CAPM. The results of the COE estimation models can be affected by prevailing market conditions at the time the analysis is performed. While the ROE that is established in a rate proceeding is intended to be forward-looking, the analyst uses current and projected market data, specifically stock prices, dividends, growth rates and interest rates, in the COE estimation models to estimate the required return for the subject company.

As a result, it is important to consider the effect of these conditions on the COE estimation models when determining the appropriate range and recommended ROE for a future period. If investors do not expect current market conditions to be sustained in the future, it is possible that the COE estimation models will not provide an accurate estimate of investors' required return during that rate period. Therefore, it is very important to consider projected market data to estimate the return for that forward-looking period.

Q. What factors are affecting the cost of equity for regulated utilities in the current and prospective capital markets?

A. The COE for regulated utility companies is being affected by several factors in the current and prospective capital markets, including: 1) relatively high inflation, 2) changes in monetary policy, and 3) increased interest rates that are expected to remain relatively high over the next few years. These factors affect the assumptions used in the COE estimation models. In this section, I discuss each of these factors and how they affect the models used to estimate the cost of equity for regulated utilities.

Q. What effect do current and prospective market conditions have on the COE for Public Service?

A. As is discussed in more detail in the remainder of this section, the combination of persistently high inflation, and the Federal Reserve's changes in monetary policy, contribute to an expectation of increased market risk and an increase in the cost of the investor-required return. It is essential that these factors be considered in setting a forward-looking ROE. Inflation has recently been at some of the highest levels seen in approximately 40 years, and while inflation has declined from these recent peaks, it remains relatively high. Interest rates, which have increased from the pandemic lows seen in 2020 are expected to remain elevated over the near term in direct response to the Federal Reserve's monetary policy. There is a strong historical inverse correlation

between interest rates (i.e., yields on long-term government bonds) and the share prices of utility stocks (i.e., as utility share prices decline, utility dividend yields increase). Since the yields on long-term government bonds currently exceed the dividend yields of utilities, and historically long-term government bond yields have been lower than the dividend yields of utilities, it is reasonable to expect that utility investors' cost of equity is increasing. Because the cost of equity in this proceeding is being estimated for the future period that the Company's rates will be in effect, and because the cost of equity is expected to increase over the near term for utilities, cost of equity estimates based in whole or in part on historical or current market conditions, as opposed to projected market conditions, will understate the cost of equity required by investors during the future period that the Company's rates determined in this proceeding will be in effect.

A. Inflationary Expectations in Current and Project Capital Market Conditions

Q. Has inflation increased significantly over the past year?

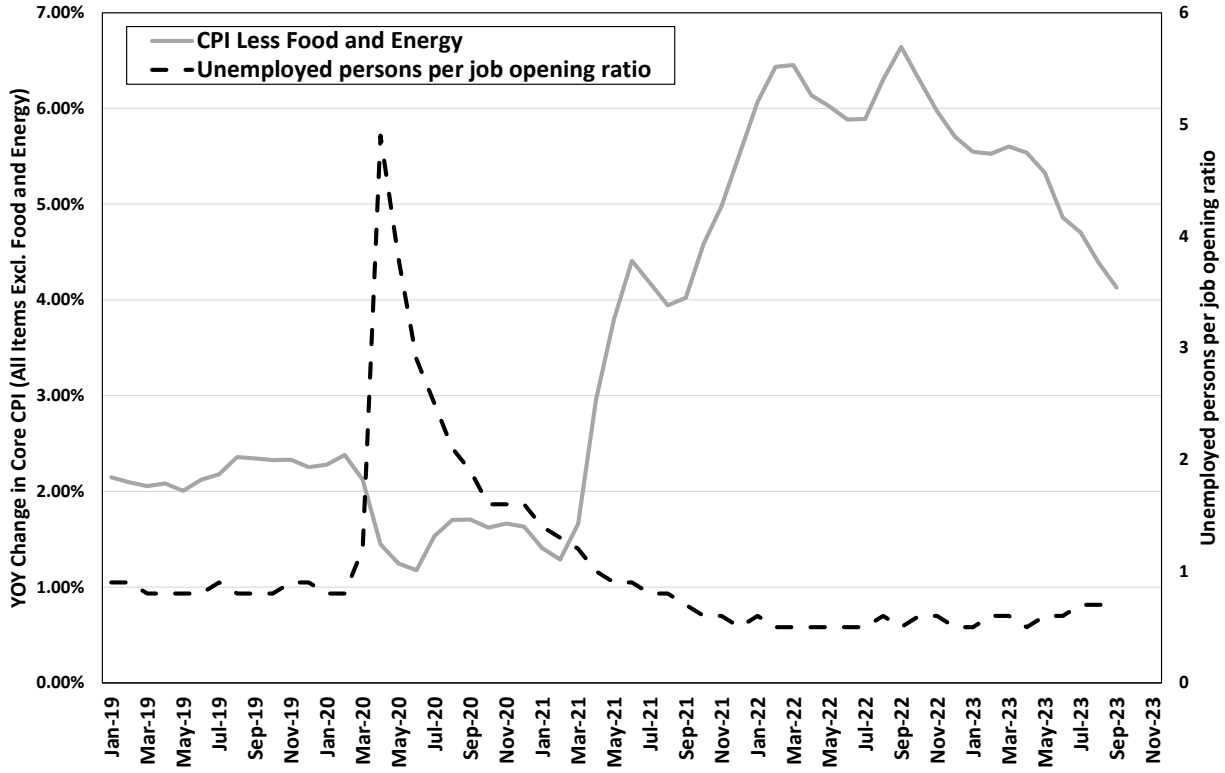
A. Yes. As shown in Figure 2, core inflation increased steadily beginning in early 2021, rising from 1.41 percent in January 2021 to a high of 6.64 percent in September 2022, which was the largest 12-month increase since 1982.[10] Since that time, while core inflation has declined in response to the Federal Reserve's monetary policy, core inflation continues to remain significantly above the Federal Reserve's target level of 2.0 percent.

Finally, as shown in Figure 2, I also considered the ratio of unemployed persons per job opening, which is currently 0.7 and has been consistently below 1.0 since 2021, despite the Federal Reserve's accelerated policy normalization. This metric indicates sustained strength in the labor

[10] Figure 2 presents the year-over-year ("YOY") change in core inflation, as measured by the Consumer Price Index ("CPI") excluding food and energy prices as published by the Bureau of Labor Statistics. I considered core inflation because it is the preferred inflation indicator of the Federal Reserve for determining the direction of monetary policy. Core inflation is preferred by the Federal Reserve because it removes the effect of food and energy prices, which can be highly volatile.

market. Given the Federal Reserve's dual mandate of maximum employment and price stability, the continued increased levels of core inflation coupled with the strength in the labor market has resulted in the Federal Reserve's sustained focus on the priority of reducing inflation.

Figure 2: Core Inflation and Unemployed Persons-to-Job Openings, January 2019 to September 2023[11]



Q. What are the expectations for inflation over the near-term?

A. Despite the declines from 40-year highs, the Federal Reserve has indicated that it expects inflation will remain above its target level over at least the next year and that monetary policy will remain restrictive in order to reduce inflation. For example, Federal Reserve Chair Powell observed at the Federal Open Market Committee (FOMC) meeting in September 2023 that while

[11] Source: Bureau of Labor Statistics.

inflation is down from its recent highs, it remains significantly above the Federal Reserve's long-term target:

> Inflation remains well above our longer-run goal of 2 percent. Based on the Consumer Price Index, or CPI, and other data, we estimate that total (Personal Consumption Expenditures) PCE prices rose 3.4 percent over the 12 months ending in August; and that, excluding the volatile food and energy categories, core PCE prices rose 3.9 percent. Inflation has moderated somewhat since the middle of last year, and longer-term inflation expectations appear to remain well anchored, as reflected in a broad range of surveys of households, businesses, and forecasters, as well as measures from financial markets. Nevertheless, the process of getting inflation sustainably down to 2 percent has a long way to go. The median projection in the SEP for total PCE inflation is 3.3 percent this year, falls to 2.5 percent next year, and reaches 2 percent in 2026.[12]

After the September 2023 and the November 2023 meetings, Chair Powell kept open the possibility of additional rate increases, considering even December this year, or thereafter if it is appropriate to do so. Further, at the September 2023 meeting, he noted that interest rates would likely remain positive for some time:

> First of all, interest rates – real interest rates are, are positive now. They're meaningfully positive, and that's a good thing. We need policy to be restrictive so that we can get inflation down to target. Okay. And we need - we're going to need that to remain to be the case for some time. So I think, you know – remember that the – of course, the SEP [Summary of Economic Projections] is not a plan that is negotiated or discussed, really, as a plan. It's accumulation, really, and what you see are the medians. It's accumulation of individual forecasts from 19 people, and then what you're seeing are the medians. So I wouldn't want to, you know, bestow upon it the idea that, that it's really a plan. But what it reflects, though, is that economic activity's been stronger than we expected – stronger than I think everyone expected. And, so what you're – what you're seeing is, this is what people believe, as of now, will be appropriate to achieve what we're looking to achieve, which is progress toward our – toward our inflation goal, as you see in the SEP.[13]

---

[12] Federal Reserve, Transcript of Chair Powell's Press Conference, September 20, 2023, p 2; https://www.federalreserve.gov/mediacenter/files/FOMCpresconf20230920.pdf

[13] *Id.*, at 6.

Similarly, he noted the following at the November 2023 meeting:

> The fact is the committee is not thinking about rate cuts right now at all. We're not talking about rate cuts. We're still very focused on the first question, which is 'have we achieved a stance of monetary policy that's sufficiently restrictive to bring inflation down to 2% over time, sustainably?' That is the question we're focusing on.[14]

B. The Use of Monetary Policy to Address Inflation

Q. What policy actions has the Federal Reserve enacted to respond to increased inflation?

A. The dramatic increase in inflation has prompted the Federal Reserve to pursue an aggressive normalization of monetary policy, removing the accommodative policy programs used to mitigate the economic effects of COVID-19. Beginning in March 2022 and through May 3, 2023, the Federal Reserve increased the target federal funds rate through a series of increases from a range of 0.00 – 0.50 percent to a range of 5.00 percent to 5.25 percent.[15] Further, as noted above, while the Federal Reserve acknowledges that inflation has declined from its peak, it still is well above the Federal Reserve's target of 2 percent. Therefore, the Federal Reserve anticipates the continued need to maintain the federal funds rate at a restrictive level in order to achieve its goal of 2 percent inflation over the long-run.

C. The Effect of Inflation and Monetary Policy on Interest Rates and the Investor-Required Return

Q. Have the yields on long-term government bonds increased in response to inflation and the Federal Reserve's normalization of monetary policy?

A. Yes. As the Federal Reserve has substantially increased the federal funds rate and decreased its holdings of Treasury bonds and mortgage-backed securities in response to increased levels of

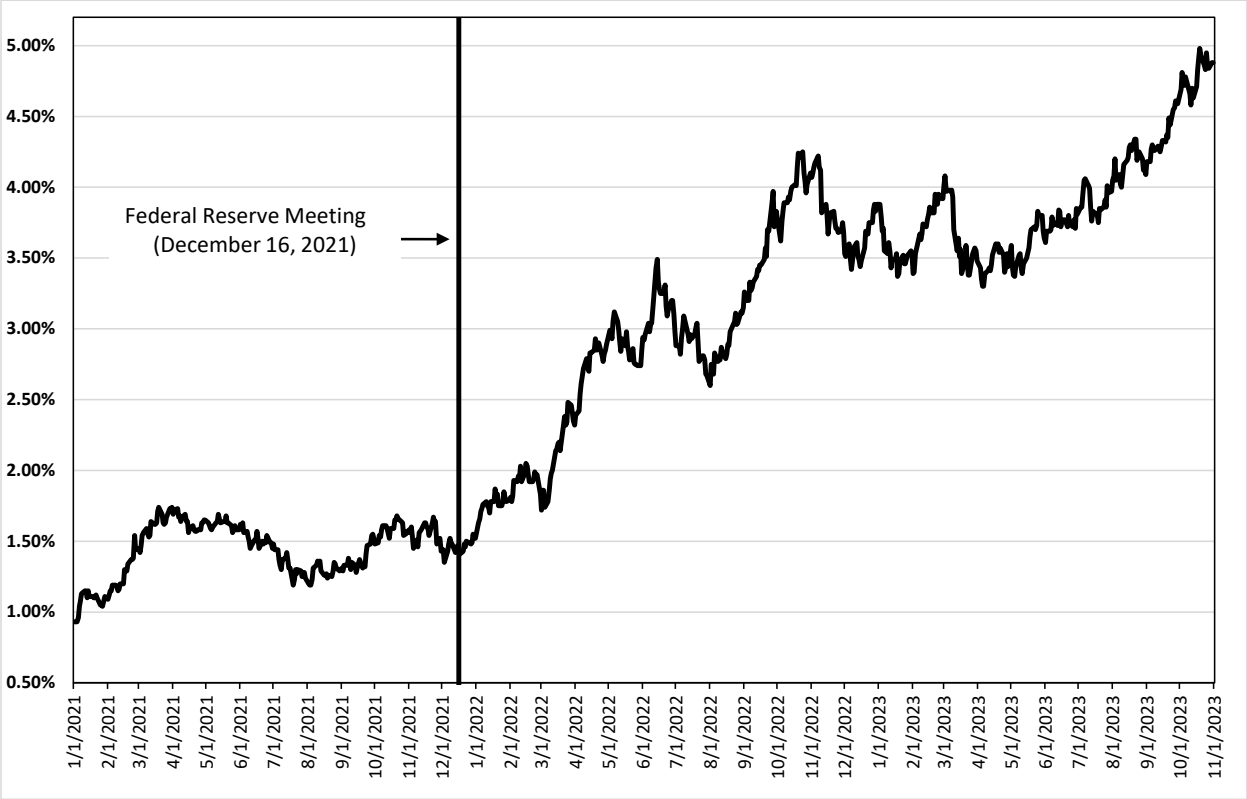
[14] CNBC "Full recap: Fed leaves rates unchanged, Powell discusses December decision", November 1, 2023.

[15] Federal Reserve, Press Releases, March 16, 2022, May 4, 2022, June 15, 2022, September 22, 2022, November 2, 2022, February 1, 2023, March 22, 2023 and May 3, 2023.

inflation that have persisted for longer than originally projected, longer term interest rates have also increased. As shown in Figure 3, since the Federal Reserve's December 2021 meeting, the yield on 10-year Treasury bonds has more than tripled, increasing from 1.47 percent on December 15, 2021, to 4.88 percent at the end of October 2023.

Figure 3: 10-Year Treasury Bond Yield—Janaury 2021– October 2023[16]



Q. What have equity analysts said about long-term government bond yields?

A. Leading equity analysts have noted that they expect the yields on long-term government bonds to remain elevated. For example, in the most recent Big Money poll released by *Barron's* in October 2023, which surveys money managers regarding the outlook for the next twelve months, two-thirds of the money managers surveyed expect the yield on the 10-year Treasury bond

[16] S&P Capital IQ Pro.

to be at least 4.50 percent in October 2024.[17] Similarly, according to the most recent *Blue Chip Financial Forecasts* report, the consensus estimate of the average yields on the 10-year and 30-year Treasury bonds are approximately 3.90 percent and 4.20 percent, respectively, through the first quarter of 2025.[18] Therefore, investors expect interest rates to remain elevated for at least the next 18 months. As a result, it is reasonable to expect that if government bond yields remain elevated, the COE will be increasing above the levels experienced in the 2020 and 2021 lower interest rate environment.

Q. How have interest rates and inflation changed since the Company's last rate case?

A. As shown in Figure 4, when the Board approved the settlement agreement and authorized an ROE of 9.60 percent in the Company's 2018 rate proceeding, interest rates (as measured by the 30-year Treasury bond yield) were 3.29 percent at the time of the Board decision, and core inflation was 2.13 percent. However, since the Company's last rate proceeding, long-term interest rates have increased approximately 155 basis points and inflation has increased approximately 200 basis points.

Figure 4: Change in Market Conditions Since Company's Last Rate Case

Docket	Decision Date	Federal Funds Rate	30-Day Average of 30-Year Treasury Bond Yield	Core Inflation Rate	Authorized ROE
ER18010029 & GR18010030	10/29/2018	2.20%	3.29%	2.13%	9.60%
Current	10/31/2023	5.33%	4.84%	4.13%

D. Expected Performance of Utility Stocks and the Investor-Required Return on Utility Investments

Q. Are utility share prices correlated to changes in the yields on long-term government bonds?

A. Yes. Interest rates and utility share prices are inversely correlated which means, for example, that an increase in interest rates will result in a decline in the share prices of utilities. For example, Goldman Sachs and Deutsche Bank examined the sensitivity of share prices of different industries to changes in interest rates over the past five years. Both Goldman Sachs and Deutsche Bank found that utilities had one of the strongest negative relationships with bond yields (i.e., increases in bond yields resulted in the decline of utility share prices).[19]

Q. How do equity analysts expect the utilities sector to perform in an increasing interest rate environment?

A. Equity analysts project that utilities will underperform the broader market given high inflation and the recent increases in interest rates. For example, Fidelity Investments classifies the utility sector as underweight[20] and Bank of America recently noted that they are "not so constructive on [u]tilities" given that the dividend yields for utilities are below both the yields available on long- and short-term treasury bonds.[21] Moreover, as referenced above, the professional investors surveyed by *Barron's* in its most recent Big Money poll selected the utility sector as one of the four equity sectors that they liked the least over the next twelve months, indicating they are projecting that utilities will underperform the broader market in 2024.[22]

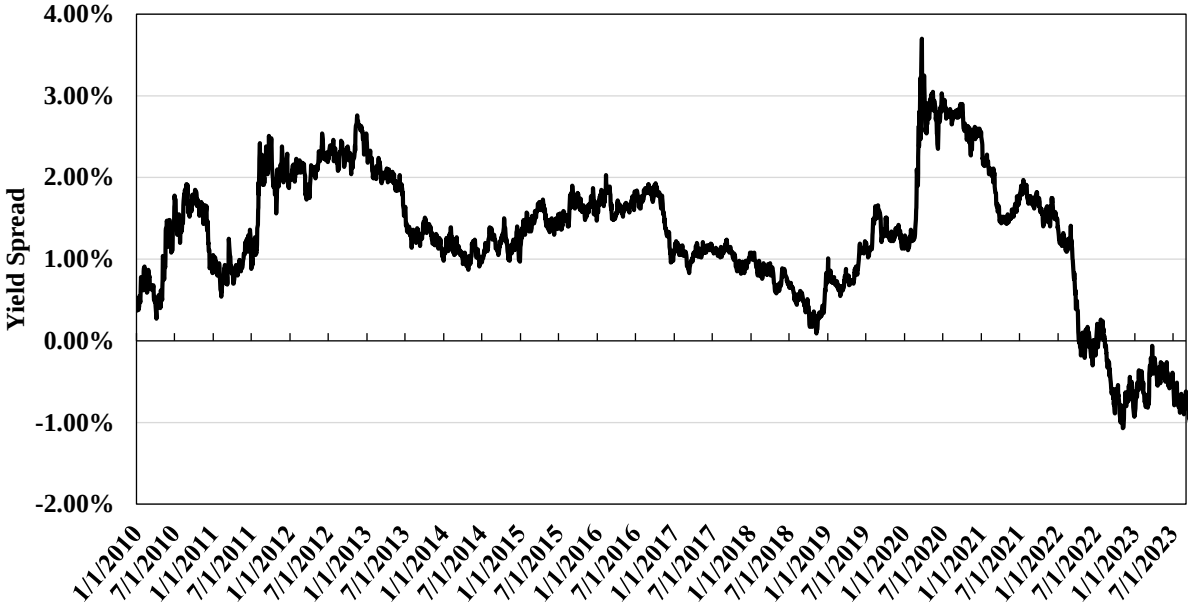
Q. Why do equity analysts expect the utility sector to underperform over the near-term?

A. While interest rates have increased substantially over the past year, the valuations of utilities have remained elevated and have not fully reflected the effect of the recent increase in interest rates. To illustrate this point, I examined the difference between the dividend yields of utility stocks and the yields on long-term government bonds from January 2010 through October 2023 ("yield spread"). I selected the dividend yield on the S&P Utilities Index as the measure of the dividend yields for the utility sector and the yield on the 10-year Treasury bond as the estimate of the yield on long-term government bonds.

As shown in Figure 5, the recent significant increase in long-term government bonds yields has resulted in the yield on long-term government bonds exceeding the dividend yields of utilities. The yield spread as of October 31, 2023 was negative 1.26 percent, meaning that the yield on the 10-year Treasury bond exceeds the dividend yield for the S&P Utilities Index. However, the long-term average yield spread from 2010 to 2023 is 1.25 percent. Therefore, the current yield spread is well below the long-term average. Because of the fact that the yield spread is currently well below the long-term average, and the expectation that interest rates will remain relatively high through at least the next year, it is reasonable to conclude that the utility sector will most likely underperform over the near-term. This is because investors that purchased utility stocks as an alternative to the lower yields on long-term government bonds would otherwise be inclined to rotate back into government bonds, particularly as the yields on long-term government bonds remain elevated, thus resulting in a decrease in the share prices of utilities.

Figure 5: Spread between the S&P Utilities Index Dividend Yield and the 10-year Treasury Bond Yield, January 2010 – October 2023[23]



Q. Do you have any further context as to how unlikely it is to have a negative yield spread of this magnitude?

A. Yes. For further context as to how unlikely it is to have a yield spread of negative 1.26 percent, I calculated the z-score for the current yield spread, which measures the number of standard deviations from the mean. The current yield spread of negative 1.26 percent has a z-score of -2.95, indicating that a yield spread of negative 1.26 percent is over 2 standard deviations from the mean of 1.25 percent.[24] In other words, 95 percent of the daily yield spread observations from 2010 through October 2023 fall between -0.45 percent and 2.95 percent, with the current yield spread of negative 1.26 percent being outside of that range. Thus, the current yield spread is an outlier, which is why equity analysts do not expect this current level to hold.

[23] S&P Capital IQ Pro and Bloomberg Professional.

[24] The z-score is calculated as: (yield spread at October 31, 2023 minus average yield spread 2010 through October 2023)/standard deviation of yield spread from 2010 through October 2023. This equals: (-1.26 minus 1.25)/0.0085.

Q. Have regulatory commissions acknowledged that the DCF model might understate the COE given the current capital market conditions of high inflation and increasing interest rates?

A. Yes. For example, in its May 2022 decision in establishing the cost of equity for Aqua Pennsylvania, Inc., the Pennsylvania Public Utility Commission ("PPUC") specifically concluded that the current capital market conditions of high inflation and increasing interest rates has resulted in the DCF model understating the utility cost of equity, and that weight should be placed on risk premium models, such as the CAPM, in the determination of the ROE:

> To help control rising inflation, the Federal Open Market Committee has signaled that it is ending its policies designed to maintain low interest rates. Aqua Exc. at 9. Because the DCF model does not directly account for interest rates, consequently, it is slow to respond to interest rate changes. However, I&E's CAPM model uses forecasted yields on ten-year Treasury bonds, and accordingly, its methodology captures forward looking changes in interest rates.
>
> Therefore, our methodology for determining Aqua's ROE shall utilize both I&E's DCF and CAPM methodologies. As noted above, the Commission recognizes the importance of informed judgment and information provided by other ROE models. In the 2012 PPL Order, the Commission considered PPL's CAPM and RP methods, tempered by informed judgment, instead of DCF-only results. We conclude that methodologies other than the DCF can be used as a check upon the reasonableness of the DCF derived ROE calculation. Historically, we have relied primarily upon the DCF methodology in arriving at ROE determinations and have utilized the results of the CAPM as a check upon the reasonableness of the DCF derived equity return. As such, where evidence based on other methods suggests that the DCF-only results may understate the utility's ROE, we will consider those other methods, to some degree, in determining the appropriate range of reasonableness for our equity return determination. In light of the above, we shall determine an appropriate ROE for Aqua using informed judgement based on I&E's DCF and CAPM methodologies.[25]

[25] Penn. Pub. Util. Comm'n et.al. v, Aqua Penn. Wastewater Inc., Pennsylvania Public Utility Commission, Docket Nos. R-2021-3027385 and R-2021-3027386, Opinion and Order, May 12, 2022, pp. 154–155.

Similarly, the Massachusetts Department of Public Utilities ("MDPU") in a recent rate case for NSTAR Electric Company concluded that given the recent increase in interest rates there was "greater certainty" the results of the DCF model were understating the cost of equity for NSTAR Electric Company.[26]

E. Conclusion

Q. What are your conclusions regarding the effect of current market conditions on the cost of equity for the Company?

A. Investors expect long-term interest rates to remain relatively high through at least 2024, in response to continued elevated levels of inflation and the Federal Reserve's normalization of monetary policy. Because the share prices of utilities are inversely correlated to interest rates, and government bond yields are already substantially greater than utility stock dividend yields, the share prices of utilities will likely decline, which is the reason a number of equity analysts have classified the sector as either underperform or underweight. The expected underperformance of utilities means that DCF models using recent historical data likely underestimate investors' required return over the period that rates will be in effect. Therefore, this expected change in market conditions supports consideration of the higher end of the range of cost of equity results produced by the DCF models. Moreover, prospective market conditions warrant consideration of forward-looking cost of equity estimation models such as the CAPM and ECAPM, which better reflect expected market conditions.

[26] The Commonwealth of Massachusetts Department of Public Utilities, D.P.U. 22-22, Petition of NSTAR Electric Company, doing business as Eversource Energy, pursuant to G.L. c. 164, § 94 and 220 CMR 5.00, for Approval of a General Increase in Base Distribution Rates for Electric Service and a Performance Based Ratemaking Plan, November 30, 2022, p. 385-386.

V. PROXY GROUP SELECTION

Q. Please provide a brief profile of Public Service.

A. Public Service is a wholly-owned subsidiary of PSEG that provides electric transmission and distribution services to approximately 2.3 million retail customers and gas distribution service to approximately 1.9 million retail customers in New Jersey, including the six largest cities.[27] For the year ended December 31, 2022, Public Service had revenue of $7.9 billion.[28] Public Service's current long-term issuer ratings are: (1) S&P A- (Outlook: Stable); and (2) Moody's Investor's Service A3 (Outlook: Stable).[29]

Q. Why have you used a group of proxy companies to estimate the cost of equity for the Company?

A. In this proceeding, I focus on estimating the cost of equity for Public Service, a rate-regulated subsidiary of PSEG. Because the cost of equity is a market-based concept and because Public Service's operations do not make up the entirety of a publicly traded entity, it is necessary to establish a group of companies that is both publicly traded and comparable to the Company in certain fundamental business and financial respects to serve as its "proxy" in the ROE estimation process.

Even if Public Service was a publicly traded entity, it is possible that transitory events could bias its market value over a given period. A significant benefit of using a proxy group is that it moderates the effects of unusual events that may be associated with any one company. The proxy companies used in my analyses all possess a set of operating and risk characteristics that are

[27] Source: Public Service Enterprise Group, Inc., 2022 SEC Form 10-K, at 3.

[28] Source: Public Service Enterprise Group, Inc., 2022 SEC Form 10-K, at 66.

[29] Source: S&P Capital IQ Pro and Moody's Investor's Service (accessed November 7, 2023).

substantially comparable to the Company's, and thus provide a reasonable basis to derive and estimate the appropriate ROE for the Company.

Q. How did you select the companies included in your proxy group?

A. I began with the group of 36 publicly traded companies that Value Line classifies as Electric Utilities and applied the following screening criteria to select a group of risk-comparable companies that:

- pay consistent quarterly cash dividends that have not been reduced in the last three years, since companies that do not meet this criteria cannot be analyzed using the constant growth DCF model;
- have investment grade long-term issuer ratings from both S&P and Moody's;
- are covered by more than one utility industry analyst;
- have positive long-term earnings growth forecasts from at least two equity analysts;
- derive at least 70 percent of the company's total operating income from regulated operations;
- derive at least 10 percent of the company's total regulated operating income from gas distribution operations; and
- were not party to a merger or transformative transaction during the analytical period considered.

Q. What is the composition of your proxy group?

A. The screening criteria discussed above resulted in a proxy group consisting of the companies shown in Figure 6 below.

Figure 6: Proxy Group

Company	Ticker
Ameren Corporation	AEE
Avista Corporation	AVA
Black Hills Corporation	BKH
CenterPoint Energy, Inc.	CNP
CMS Energy Corporation	CMS
Consolidated Edison, Inc.	ED
Eversource Energy	ES
MGE Energy, Inc.	MGEE
NorthWestern Corporation	NWE
Sempra Energy	SRE
Southern Company	SO
Wisconsin Energy Corporation	WEC
Xcel Energy Inc.	XEL

Q. Do your screening criteria result in a proxy group that is risk comparable to Public Service?

A. Yes, they do. The overall purpose of developing a set of screening criteria is to select a proxy group of companies that align with the financial and operational characteristics of Public Service and that investors would view as comparable to the Company. I developed the screens and thresholds for each screen based on judgment with the intention of balancing the need to maintain a proxy group that is of sufficient size with establishing a proxy group of companies that are comparable in business and financial risk to Public Service. The Company operates as a combination electric and gas utility and is viewed by investors as a combination company. The Company raises capital as a combination company, and does not issue separate debt or equity for electric and gas operations. Thus, a proxy group consisting combination electric and gas utilities is most risk comparable to Public Service and resulted in the group of 13 companies shown in Figure 6.

VI. COST OF EQUITY ESTIMATION

Q. Please briefly discuss the ROE in the context of the regulated rate of return ("ROR").

A. The ROE is the cost rate applied to the equity capital in the ROR. The ROR for a regulated utility is the weighted average cost of capital, in which the costs of the individual sources of capital are weighted by their respective proportion (i.e. book values) in the utility's capital structure. While the costs of debt and preferred stock can be directly observed, the COE is market-based and, therefore, must be estimated based on observable market data.

Q. How is the required COE determined?

A. The required COE is estimated by using analytical techniques that rely on market-based data to quantify investor expectations regarding equity returns, adjusted for certain incremental costs and risks. Informed judgment is then applied to determine where the company's COE falls within the range of results produced by multiple analytical techniques. The key consideration in determining the COE is to ensure that the methodologies employed reasonably reflect investors' views of the financial markets in general, as well as the subject company (in the context of the proxy group), in particular.

Q. What methods did you use to establish your recommended ROE in this proceeding?

A. I considered the results of the Constant Growth DCF model, the CAPM, the ECAPM, and a Bond Yield Plus Risk Premium analysis. As discussed in more detail below, a reasonable ROE estimate appropriately considers alternative methodologies and the reasonableness of their individual and collective results.

Q. Why is it important to use more than one analytical approach?

A. Because the COE is not directly observable, it must be estimated based on both quantitative and qualitative information. When faced with the task of estimating the COE, analysts and investors are inclined to gather and evaluate as much relevant data as reasonably can be analyzed. Several models have been developed to estimate the COE, and I use multiple approaches to estimate the COE. As a practical matter, however, all the models available for estimating the COE are subject to limiting assumptions or other methodological constraints. Consequently, many well-regarded finance texts recommend using multiple approaches when estimating the COE. For example, Copeland, Koller, and Murrin[30] suggest using the CAPM and Arbitrage Pricing Theory model, while Brigham and Gapenski[31] recommend the CAPM, DCF, and Bond Yield Plus Risk Premium approaches**.**

Q. Do current market conditions increase the importance of using more than one analytical approach?

A. Yes. As discussed previously, interest rates have increased substantially over the past year and are expected to remain elevated over at least the next year from the lows seen during the COVID-19 pandemic. While the share prices of utilities have declined, the negative yield spread noted above is an indication that the share prices have not declined sufficiently to account for the recent rise in interest rates. As a result, equity analysts expect the utility sector to continue to underperform over the next year. Given the expected underperformance, it is reasonable to conclude that the DCF model is likely understating the forward-looking cost of equity because the

---

[30] Tom Copeland, Tim Koller and Jack Murrin, Valuation: Measuring and Managing the Value of Companies, 3rd Ed. (New York: McKinsey & Company, Inc., 2000), at 214.

[31] Eugene Brigham, Louis Gapenski, Financial Management: Theory and Practice, 7th Ed. (Orlando: Dryden Press, 1994), at 341.

model relies on historical share prices. The CAPM, ECAPM, and Bond Yield Plus Risk Premium analyses offer some balance through the use of interest rates as a direct input into the models and therefore may better reflect the market conditions expected when the Company's rates are in effect. These recent changes in market conditions highlight the benefit of using multiple models since each model relies on different assumptions, certain of which may better reflect current and projected market conditions at different times. Therefore, it is important to use multiple analytical approaches to ensure that the cost of equity results reflect market conditions that are expected during the period that the Company's rates will be in effect.

Q. Has the Board made similar findings regarding the reliance on multiple models?

A. Yes. It is my understanding that in its order in Docket No. ER12111052 for Jersey Central Power and Light Company, the Board noted that rate of return experts use a number of models including the DCF, CAPM, Risk Premium and Comparable Earnings to estimate the return required by investors. Specifically, the Board noted:

> In determining the cost of equity capital for a regulated utility, rate of return experts typically use a variety of financial models to simulate the returns assertedly required by investors. These include Discounted Cash Flow (DCF) models, Risk Premium models, Capital Asset Pricing Models (CAPM), Comparable Earnings models and variations thereof. However, it is widely acknowledged that these economic models constitute estimates, which, although probative, are not necessarily precise. The imprecision in the estimates provided by these models is more pronounced as a result of the current economic environment still recovering from the Great Recession, characterized by some as the worst economy since the Great Depression.[32]

In the order, the Board accepted an ROE of 9.75 percent for JCP&L which was supported by the ALJ and ultimately recommended by Staff based on a review of each of

[32] BPU Docket No. ER12111052, OAL Docket No. PUC16310-12, Order Adopting Initial Decision with Modifications and Clarifications, March 18, 2015, at 71.

the model results presented by the witnesses in the case and recently authorized ROEs in other jurisdictions.[33] In supporting the recommendation of Staff, the ALJ concluded that the results of each model are affected by multiple factors including current market conditions. Specifically, the ALJ concluded that:

> [e]ach method has multiple factors, and the parties have offered numerous criticisms of the choices made by opposing expert witnesses. A key consideration concerns the time period used by the experts in selecting a dividend yield under the DCF model or the risk-free rate under the CAPM method due to the fact that interest rates have been at historic lows in recent years. For example, with the CAPM method, Ms. Ahern used interest rates on thirty-year Treasury bonds going as far back as 1926 producing an average of 5.32 percent, which led to a risk free rate of 4.17 percent. As Mr. Kahal points out, rates on thirty-year Treasury bonds have been closer to 3.00 percent in recent years. In contrast, Mr. Kahal based the dividend yield under his DCF analysis on results from the six months ending April 2013. Development of the dividend yield from data during a period of historically low interest rates may produce a result which is lower than will prevail when the new rates are in effect. Mr. O'Donnell's analysis in this respect is similar to that of Mr. Kahal.[34]

Thus, the Board, an ALJ, and Board Staff have all recognized the importance of considering the results of each model presented in the rate case because market conditions can have an effect on the results produced by each of the ROE estimation models.

A. CAPM Analysis

Q. Please briefly describe the CAPM.

A. The CAPM is a risk premium approach that estimates the COE for a given security as a function of a risk-free return plus a risk premium to compensate investors for the non-diversifiable, systematic risk of that security. Systematic risk is the risk inherent in the entire market or market

---

[33] *Id.*, at 10.

[34] BPU Docket No. ER12111052, OAL Docket No. PUC16310-12, Initial Decision, January 8, 2015, at 27.

segment—which cannot be diversified away using a portfolio of assets. Unsystematic risk is the risk of a specific company that can, theoretically, be mitigated through portfolio diversification.

The CAPM is defined by four components, each of which must theoretically be a forward-looking estimate:

$$K_e = r_f + \beta(r_m - r_f) \quad [1]$$

Where:

K_e = the required market COE;

β = Beta coefficient of an individual security;

r_f = the risk-free rate of return; and

r_m = the required return on the market.

In this specification, the term $(r_m - r_f)$ represents the market risk premium. According to the theory underlying the CAPM, because unsystematic risk can be diversified away, investors should only be concerned with systematic or non-diversifiable risk. Systematic risk is measured by Beta. Beta is a measure of the volatility of a security as compared to the market as a whole. Beta is defined as:

$$\beta = \frac{Covariance(r_e, r_m)}{Variance(r_m)} \quad [2]$$

The variance of the market return (i.e., Variance (r_m)) is a measure of the uncertainty of the general market, and the covariance between the return on a specific security and the general market (i.e., Covariance (r_e, r_m)) reflects the extent to which the return on that security will respond to a given change in the general market return. Thus, Beta represents the risk of the security relative to the general market.

Q. What risk-free rate did you use in your CAPM analysis?

A. I relied on three sources for my estimate of the risk-free rate: (1) the current 30-day average yield on 30-year U.S. Treasury bonds, which is 4.84 percent;[35] (2) the average projected 30-year U.S. Treasury bond yield for the first quarter of 2024 through the first quarter of 2025, which is 4.44 percent;[36] and (3) the average projected 30-year U.S. Treasury bond yield for 2025 through 2029, which is 3.80 percent.[37]

Q. What Beta coefficients did you use in your CAPM analysis?

A. As shown Schedule AEB-5, I used the Beta coefficients for the proxy group companies as reported by Bloomberg and Value Line. The Beta coefficients reported by Bloomberg were calculated using ten years of weekly returns relative to the S&P 500 Index. Value Line's calculation is based on five years of weekly returns relative to the New York Stock Exchange Composite Index.

As shown in Schedule AEB-5, I also considered an additional CAPM analysis that relies on the long-term average utility Beta coefficient for the companies in my proxy group. As shown in Schedule AEB-6, the long-term average utility Beta coefficient was calculated as an average of the Value Line Beta coefficients for the companies in my proxy group from 2013 through 2022.

Q. How did you estimate the market risk premium in the CAPM?

A. I estimated the Market Risk Premium ("MRP") as the difference between the implied expected equity market return and the risk-free rate. As shown in Schedule AEB-7, the expected market return is calculated using the constant growth DCF model discussed below as applied to

---

[35] Bloomberg Professional as of October 31, 2023.

[36] Blue Chip Financial Forecasts, Vol. 42, No. 11, at 2 (November 1, 2023).

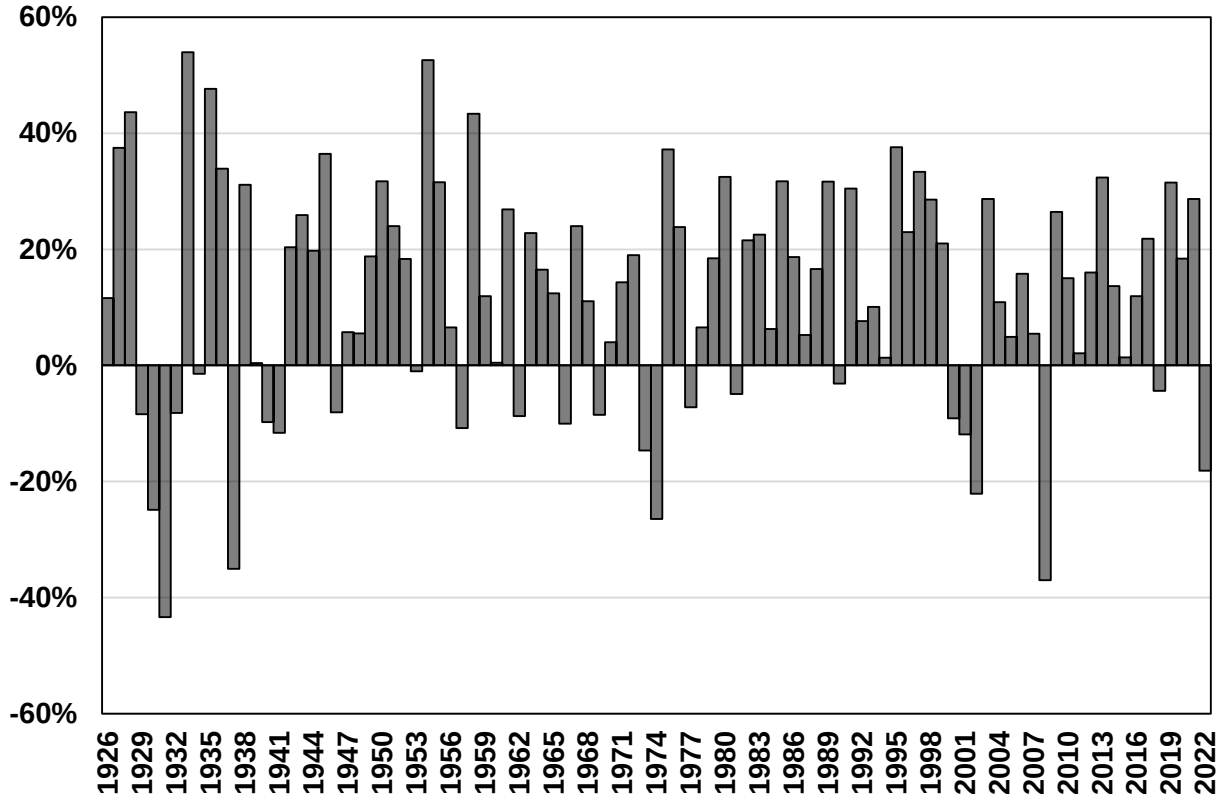
[37] Blue Chip Financial Forecasts, Vol. 41, No. 6, at 14 (June 1, 2023).

the companies in the S&P 500 Index. Based on an estimated market capitalization-weighted dividend yield of 1.88 percent and a weighted long-term growth rate of 10.51 percent, the estimated required market return for the S&P 500 Index as of October 31, 2023 is 12.49 percent.

Q. How does the current expected market return of 12.49 percent compare to observed historical market returns?

A. Given the range of annual equity returns that have been observed over the past century (shown in Figure 7), a current expected return of 12.49 percent is not unreasonable. In 50 out of the past 97 years (or roughly 52 percent of observations), the realized equity return was at least 12.49 percent or greater**.**

Figure 7: Realized U.S. equity market returns (1926-2022) [38]



[38] Depicts total annual returns on large company stocks, as reported in the 2022 *Kroll* SBBI Yearbook**.**

Q. Did you consider another form of the CAPM in your analysis?

A. Yes. I have also considered the results of an ECAPM or alternatively referred to as the Zero-Beta CAPM[39] in estimating the COE for Public Service. The ECAPM calculates the product of the adjusted Beta coefficient and the market risk premium and applies a weight of 75.00 percent to that result. The model then applies a 25.00 percent weight to the market risk premium, without any effect from the Beta coefficient. The results of the two calculations are summed, along with the risk-free rate, to produce the ECAPM result, as noted in Equation [3] below:

$$k_e = r_f + 0.75\beta(r_m - r_f) + 0.25(r_m - r_f) \qquad [3]$$

Where:

k_e = the required market COE;

β = Adjusted Beta coefficient of an individual security;

rf = the risk-free rate of return; and

r_m = the required return on the market as a whole.

In essence, the Empirical form of the CAPM addresses the tendency of the "traditional" CAPM to underestimate the cost of equity for companies with low Beta coefficients such as regulated utilities. In that regard, the ECAPM is not redundant to the use of adjusted Betas; rather, it recognizes the results of academic research indicating that the risk-return relationship is different (in essence, flatter) than estimated by the CAPM, and that the CAPM underestimates the "alpha," or the constant return term.[40]

---

[39] *See* Roger A. Morin, New Regulatory Finance at 189, Public Utilities Reports, Inc. (2006).

[40] *Id.*, at 191.

As with the CAPM, my application of the ECAPM uses the forward-looking market risk premium estimates, the three yields on 30-year Treasury securities noted earlier as the risk-free rate, and the Bloomberg, Value Line, and long-term average Beta coefficients.

Q. What are the results of your CAPM analyses?

A. As shown in Figure 8 (see also Schedule AEB-5), my traditional CAPM analysis produces a range of returns from 10.20 percent to 11.66 percent. The ECAPM analysis results range from 10.77 percent to 11.87 percent.

Figure 8: CAPM and ECAPM Results

	Current Risk-Free Rate (4.84%)	Q1 2024 – Q1 2025 Projected Risk-Free Rate (4.44%)	2025-2029 Projected Risk-Free Rate (3.80%)
		CAPM	
Value Line Beta	11.66%	11.62%	11.55%
Bloomberg Beta	10.84%	10.75%	10.61%
Long-term Avg. Beta	10.47%	10.37%	10.20%
		ECAPM	
Value Line Beta	11.87%	11.84%	11.79%
Bloomberg Beta	11.25%	11.18%	11.08%
Long-term Avg. Beta	10.98%	10.90%	10.77%

B. Constant Growth DCF Model

Q. Please describe the DCF approach.

A. The DCF approach is based on the theory that a stock's current price represents the present value of all expected future cash flows. In its most general form, the DCF model is expressed as follows:

$$P_0 = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \cdots + \frac{D_\infty}{(1+k)^\infty} \qquad [4]$$

Where P_0 represents the current stock price, $D_1 \ldots D\infty$ are all expected future dividends, and k is the discount rate, or required ROE. Equation [4] is a standard present value calculation that can be simplified and rearranged into the following form:

$$k = \frac{D_0(1+g)}{P_0} + g \qquad [5]$$

Equation [5] is often referred to as the Constant Growth DCF model in which the first term is the expected dividend yield and the second term is the expected long-term growth rate.

Q. What assumptions are required for the Constant Growth DCF model?

A. The Constant Growth DCF model requires the following four assumptions: (1) a constant growth rate for earnings and dividends; (2) a stable dividend payout ratio; (3) a constant price-to-earnings ("P/E") ratio; and (4) a discount rate greater than the expected growth rate. To the extent that any of these assumptions are violated, considered judgment and/or specific adjustments should be applied to the results.

Q. What market data did you use to calculate the dividend yield in your Constant Growth DCF model?

A. The dividend yield in my Constant Growth DCF model is based on the proxy companies' current annualized dividend and average closing stock prices over the 30-, 90-, and 180-trading days ended October 31, 2023.

Q. Why did you use 30-, 90-, and 180-day averaging periods?

A. I use an average of recent trading days to calculate the term P_0 in the DCF model to reflect current market data while also ensuring that the result of the model is not skewed by anomalous events that may affect stock prices on any given trading day.

Q. Did you make any adjustments to the dividend yield to account for periodic growth in dividends?

A. Yes, I did. Because utility companies tend to increase their quarterly dividends at different times throughout the year, it is reasonable to assume that dividend increases will be evenly distributed over calendar quarters. Given that assumption, it is reasonable to apply one-half of the expected annual dividend growth rate for purposes of calculating the expected dividend yield component of the DCF model. This adjustment ensures that the expected first-year dividend yield is, on average, representative of the coming twelve-month period, and does not overstate the aggregated dividends to be paid during that time.

Q. Why is it important to select appropriate measures of long-term growth in applying the DCF model?

A. In its Constant Growth form, the DCF model (*i.e.*, Equation [2]) assumes a single growth estimate in perpetuity. To reduce the long-term growth rate to a single measure, one must assume that the payout ratio remains constant and that earnings per share, dividends per share and book value per share all grow at the same constant rate. Over the long run, however, dividend growth can only be sustained by earnings growth. Therefore, it is important to incorporate a variety of sources of long-term earnings growth rates into the Constant Growth DCF model.

Q. Which sources of long-term earnings growth rates did you use?

A. My Constant Growth DCF model incorporates three commonly referenced sources of long-term earnings growth rates: (1) Zacks Investment Research; (2) Yahoo! Finance; and (3) Value Line Investment Survey.

Q. How did you calculate the range of results for the Constant Growth DCF Models?

A. I calculated the low result for my DCF model using the minimum growth rate (*i.e.*, the lowest of the Value Line, Yahoo! Finance, and Zacks earnings growth rates) for each of the proxy group companies. Thus, the low result reflects the minimum DCF result for the proxy group. I used a similar approach to calculate the high results, using the highest growth rate for each proxy group company. The mean results were calculated using the average growth rate from all three sources for each proxy group company.

Q. What were the results of your Constant Growth DCF analyses?

A. Figure 9 (see also Schedule AEB-2 and 4) summarizes the results of my DCF analyses. As shown in Figure 9, the median and mean DCF results range from 9.32 percent to 9.84 percent, and the median high and mean high results are in the range of 10.05 percent to 10.55 percent. While I also summarize the low DCF results, given the expected underperformance of utility stocks and thus the likelihood that the DCF model is understating the COE, I do not believe it is appropriate to consider the low DCF results at this time.

Figure 9: Constant Growth Discounted Cash Flow Results

Constant Growth DCF - Mean			
	Min Growth Rate	**Mean Growth Rate**	**Max Growth Rate**
30-Day Average	8.78%	9.69%	10.55%
90-Day Average	8.57%	9.47%	10.34%
180-Day Average	8.42%	9.32%	10.19%
Constant Growth DCF - Median			
	Min Growth Rate	**Mean Growth Rate**	**Max Growth Rate**
30-Day Average	8.87%	9.84%	10.44%
90-Day Average	8.53%	9.60%	10.27%
180-Day Average	8.31%	9.48%	10.05%

Q. What are your conclusions about the results of the DCF models?

A. As discussed previously, one primary assumption of the Constant Growth DCF model is a constant P/E ratio. That assumption is heavily influenced by the market price of utility stocks. Since utility stocks are expected to underperform the broader market over the near-term as interest rates increase, it is important to consider the results of the DCF models with caution. This means that the results of the current DCF models are below where they would otherwise be under more normal market conditions. Therefore, while I have given weight to the results of the Constant Growth DCF model, my recommendation also gives weight to the results of other COE estimation models.

C. Bond Yield Plus Risk Premium Analysis

Q. Please describe the Bond Yield Plus Risk Premium approach.

A. In general terms, this approach is based on the fundamental principle that equity investors bear the residual risk associated with equity ownership and therefore require a premium over the return they would have earned as a bondholder. That is, because returns to equity holders have greater risk than returns to bondholders, equity investors must be compensated to bear that risk. Risk premium approaches, therefore, estimate the COE as the sum of the equity risk premium and the yield on a particular class of bonds. In my analysis, I used actual authorized returns for electric utilities as the historical measure of the COE to determine the risk premium.

Q. Are there other considerations that should be addressed in conducting this analysis?

A. Yes, there are. It is important to recognize both academic literature and market evidence indicating that the equity risk premium (as used in this approach) is inversely related to the level of interest rates. That is, as interest rates increase, the equity risk premium decreases, and vice versa. Consequently, it is important to develop an analysis that: (1) reflects the inverse relationship between interest rates and the equity risk premium; and (2) relies on recent and expected market conditions. Such an analysis can be developed based on a regression of the risk premium as a function of U.S. Treasury bond yields. If we let authorized ROEs for electric utilities serve as the measure of required equity returns and define the yield on the long-term U.S. Treasury bond as the

relevant measure of interest rates, the risk premium simply would be the difference between those two points.[41]

Q. Is the Bond Yield Plus Risk Premium analysis relevant to investors?

A. Yes, it is. Investors are aware of ROE awards in other jurisdictions, and they consider those awards as a benchmark for a reasonable level of equity returns for utilities of comparable risk operating in other jurisdictions. Because my Bond Yield Plus Risk Premium analysis is based on authorized ROEs for utility companies relative to corresponding Treasury yields, it provides relevant information to assess the return expectations of investors in the current interest rate environment.

Q. What did your Bond Yield Plus Risk Premium analysis reveal?

A. As shown in Figure 10 below, from 1980 through October 2023, there was a strong negative relationship between risk premia and interest rates. To estimate that relationship, I conducted a regression analysis using the following equation:

$$RP = a + b(T) \quad [6]$$

Where:

RP = Risk Premium (difference between allowed ROEs and the yield on 30-year U.S. Treasury bonds)

a = intercept term

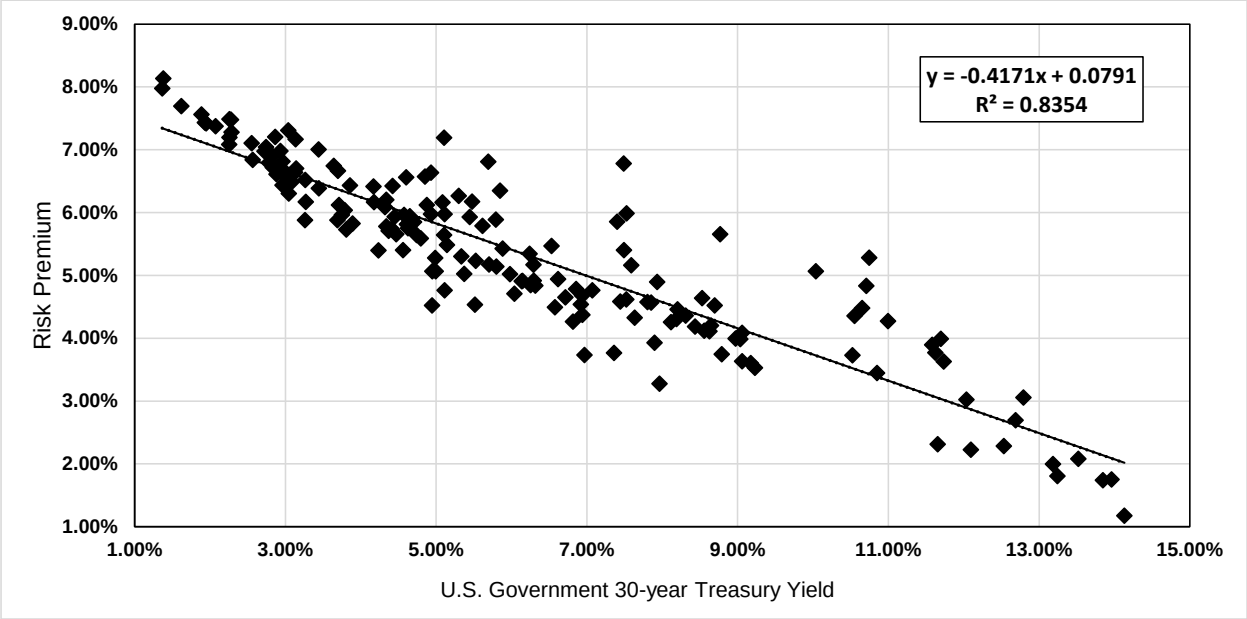
b = slope term

[41] *See* S. Keith Berry, Interest Rate Risk and Utility Risk Premia during 1982-93, Managerial and Decision Economics, Vol. 19, No. 2 (March, 1998), in which the author used a methodology similar to the regression approach described below, including using allowed ROEs as the relevant data source, and came to similar conclusions regarding the inverse relationship between risk premia and interest rates. *See also* Robert S. Harris, Using Analysts' Growth Forecasts to Estimate Shareholders Required Rates of Return at 66, Financial Management (Spring 1986).

T = 30-year U.S. Treasury bond yield

Data regarding allowed ROEs were derived from all of electric utility rate cases from 1980 through October 2023 as reported by Regulatory Research Associates ("RRA").[42] This equation's coefficients were statistically significant at the 99.00 percent level.

Figure 10: Risk Premium Results



As shown in Schedule AEB-8, based on the current 30-day average of the 30-year U.S. Treasury bond yield (i.e., 4.84 percent), the risk premium would be 5.89 percent, resulting in an estimated ROE of 10.74 percent. Based on the near-term (Q1 2024 – Q1 2025) projections of the 30-year U.S. Treasury bond yield (i.e., 4.44 percent), the risk premium would be 6.06 percent, resulting in an estimated ROE of 10.50 percent. Based on longer-term (2025 – 2029) projections of the 30-year U.S. Treasury bond yield (i.e., 3.80 percent), the risk premium would be 6.33 percent, resulting in an estimated ROE of 10.13 percent.

[42] This analysis began with a total of 2,379 cases and was screened to eliminate limited issue rider cases, transmission-only cases, and cases that were silent with respect to the authorized ROE. After applying those screening criteria, the analysis was based on data for 1,747 cases.

Q. How did the results of the Bond Yield Risk Premium inform your recommended ROE for the Company?

A. I have considered the results of the Bond Yield Risk Premium analysis in setting my recommended ROE for Public Service. As noted above, investors consider the ROE award of a company when assessing the risk of that company as compared to utilities of comparable risk operating in other jurisdictions.

VII. REGULATORY AND BUSINESS RISKS

Q. Taken alone, do the results from the COE estimation models for the proxy group provide an appropriate estimate of the COE for the Company?

A. No. These analyses provide only a range of the appropriate estimate of the Company's cost of equity. There are several additional factors that must be taken into consideration when determining where the Company's cost of equity falls within the range of results. These factors, which are discussed below, should be considered with respect to their overall effect on the Company's risk profile.

A. Management Performance Recognition

Q. Why is management performance important to consider in determining the ROE of a company?

A. Regulatory commission decisions can influence the overall operations of the utilities that are under its regulation. In rate proceedings, the regulatory commissions review all costs to determine the reasonableness of the overall operating cost of the Company for the benefits of customers. In addition to the actual costs incurred, it is important that the regulatory commission consider the overall management performance and service quality that is derived from those costs. Regulation that is constructive and supportive of management's ability to achieve low costs and high overall service quality plays an important role in utility regulation and the continued success of top performing companies.

Q. Has Public Service conducted any analysis of its management performance as compared with a benchmark group?

A. Yes. The Direct Testimony of Public Service witness Mr. Adams describes in detail the performance benchmarking analysis that was undertaken and summarizes the results for Public Service as compared with national, regional, as well as a New Jersey specific regional benchmarking group and the proxy group that I relied on in setting the ROE. Mr. Adams benchmarks Public Service's performance on the basis of electric and natural gas distribution operating and administrative costs as well as reliability and customer satisfaction.

Q. Please summarize the results of that analysis.

A. Mr. Adams's analysis demonstrates that that Public Service's electric and gas operating costs are significantly lower than the peer group. In addition, Public Service's reliability and customer satisfaction ratings are consistently higher than the peer group.[43] The combination of these metrics indicates a well-managed company that is focused on controlling costs and providing high levels of reliability and customer satisfaction.

Q. Is the Company required to maintain a minimum level of reliability for its electric distribution system?

A. Yes. As discussed in the Panel Testimony of Public Service Witnesses Mr. Schmid and Mr. Fonseca, the Board sets annual reliability performance level targets for the electric utilities in New Jersey based on the average reliability level for an individual utility over the last five years. Given that Public Service's reliability ratings have been consistently higher than other electric utilities in New Jersey, Public Service's required reliability targets are also higher than the other electric utilities in New Jersey. As a result, absent the Commission's consideration of the Company's

[43] Reliability metrics measure the number and duration of interruptions. Therefore, lower metrics in these areas, as discussed by Mr. Adams, reflect stronger performance.

management performance in determining the authorized ROE in this proceeding, the Company would be held to higher reliability standard than its peers; however, the Company's ROE has historically been set at a level comparable to peers which are subject to lower reliability targets. It is therefore important that the Commission consider the Company's excellent management performance which has resulted in lower costs and higher reliability relative to its peers in determining the authorized ROE for Public Service.

Q. How does the benchmarking analysis affect your view of the authorized ROE for Public Service?

A. Based on the results of the benchmarking analysis, Public Service's electric and gas distribution customers have benefitted significantly from the Company's efficiency and cost containment efforts. In addition, while providing service at a lower cost than the peer group, Public Service's reliability metrics are stronger than the peer group average. Finally, the Company's customer service is strong and continually improving over the analytical period relied on by Mr. Adams. In my view, the benchmarking analysis demonstrates that Public Service's management performance has provided its customers with significantly lower cost and more reliable service than other similar electric and gas utilities and therefore supports an ROE that is above the mean of the proxy group results. Continued demonstrated management excellence that provides tangible benefits to customers such as lower overall costs and higher reliability metrics should be considered by the Board and supported through constructive regulation.

B. Capital Expenditures

Q. Please summarize the capital expenditure requirements for Public Service's electric and natural gas distribution operations.

A. The Company's current projections for 2023 through 2027 include approximately $17 billion in capital investments for the period.[44] Based on the Company's net utility plant of approximately $32.83 billion plus the Energy Efficiency regulatory asset of $0.4 billion as of December 31, 2022,[45] the projected capital expenditures are approximately 51.15 percent of Public Service's net utility investment balance as of December 31, 2022.

Q. How is the Company's risk profile affected by its substantial capital expenditures requirements?

A. As with any utility faced with substantial capital expenditure requirements, the Company's risk profile may be adversely affected in two significant and related ways: (1) the heightened level of investment increases the risk of under-recovery or delayed recovery of the invested capital; and (2) an inadequate return would put downward pressure on key credit metrics.

Q. Do credit rating agencies recognize the risks associated with elevated levels of capital expenditures?

A. Yes, they do. From a credit perspective, the additional pressure on cash flows associated with high levels of capital expenditures exerts corresponding pressure on credit metrics and, therefore, credit ratings. To that point, S&P explains the importance of regulatory support for large capital projects:

---

[44] PSEG December 2023 Investor Update, approximate mid-point of PSE&G capital spending range 2023-2027 $16.0-$18.5B.

[45] From the PSEG 2022 10K. Net utility plant is from the PSE&G Consolidated Balance Sheet, page 68, Net Property, Plant and Equipment (December 31, 2022 balance is $32,830 million); the Energy Efficiency regulatory asset is from the Financial Statement Note 7, page 88 (Green Program Recovery Charges (GPRC), December 31, 2022 non-current asset balance is $447 million).

> When applicable, a jurisdiction's willingness to support large capital projects with cash during construction is an important aspect of our analysis. This is especially true when the project represents a major addition to rate base and entails long lead times and technological risks that make it susceptible to construction delays. Broad support for all capital spending is the most credit-sustaining. Support for only specific types of capital spending, such as specific environmental projects or system integrity plans, is less so, but still favorable for creditors. Allowance of a cash return on construction work-in-progress or similar ratemaking methods historically were extraordinary measures for use in unusual circumstances, but when construction costs are rising, cash flow support could be crucial to maintain credit quality through the spending program. Even more favorable are those jurisdictions that present an opportunity for a higher return on capital projects as an incentive to investors.[46]

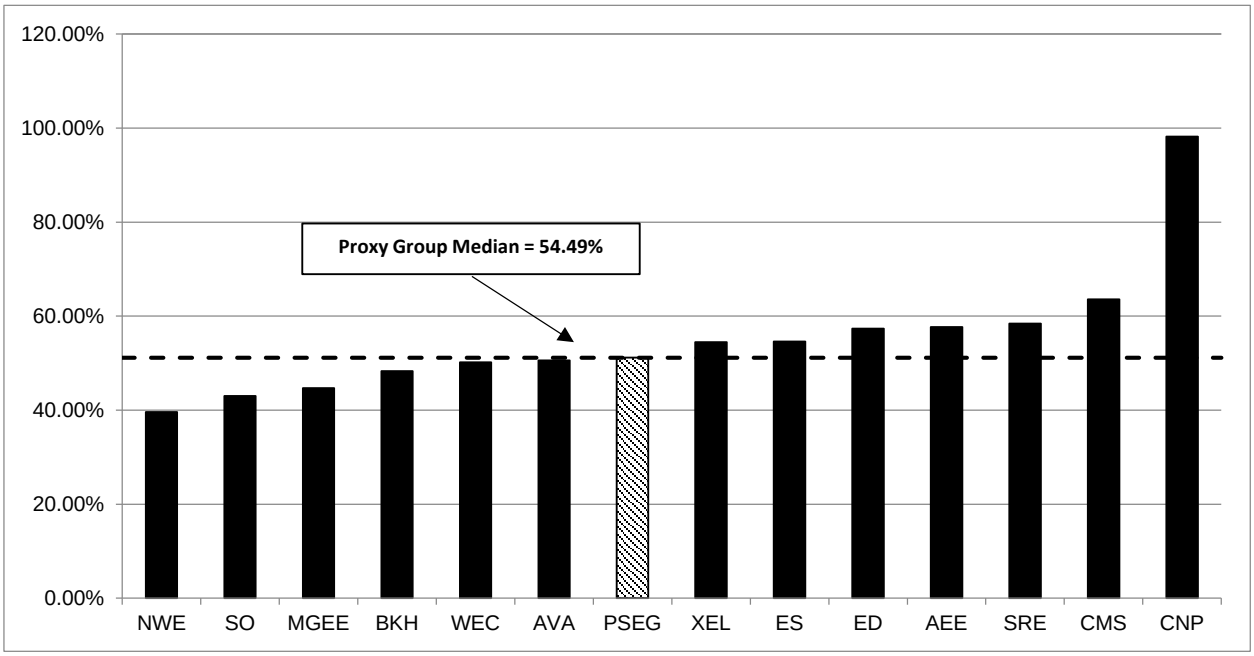
Therefore, to the extent that Public Service's rates do not permit the opportunity to earn an appropriate return and recover its capital investments on a regular and timely basis, the Company will face increased recovery risk and thus increased pressure on its credit metrics.

Q. How do Public Service's capital expenditure requirements compare to those of the proxy group companies?

A. As shown in Schedule AEB-9, I calculated the ratio of expected capital expenditures to net utility plant for the Company and each of the companies in the proxy group by dividing each company's projected capital expenditures for the period from 2024-2028 by its total net utility plant as of December 31, 2022. As shown in Schedule AEB-9 (see also Figure 11 below), the Company's ratio of capital expenditures as a percentage of net utility plant is 56.15 percent, which is similar to the median for the proxy group companies of 54.49 percent.

[46] S&P Global Ratings, "Assessing U.S. Investor-Owned Utility Regulatory Environments," August 10, 2016, at 7.

Figure 11: Comparison of Capital Expenditures



Q. Does Public Service have a capital tracking mechanism to recover the costs associated with its capital expenditures plan between rate cases?

A. Partially. N.J.A.C. 14:3-2A, Infrastructure Investment Program ("IIP"), allows for a utility to obtain Board approval for the accelerated recovery of qualifying capital investments between rate cases. Public Service has periodic rate adjustments, on a lag, for a portion of its investments of specific Board-approved programs, for a portion of the Company's electric and natural gas operations. This allows Public Service to recover a portion of certain investments in the construction, installation and rehabilitation of certain non-revenue producing utility plant and facilities that meet safety, reliability or resiliency standards. For example, through the IIP, Public Service recovers a portion of the capital costs associated with the Company's Energy Strong II program, Infrastructure Advancement Program, and Gas System Modernization II Program ("GSMP"), albeit on a lag. In addition, the Company is able to recover capital costs associated with its Clean Energy Future – Energy Efficiency, other Energy Efficiency, and several solar

programs through the Green Programs Recovery Charge, which is available to both Public Service's electric and gas operations.

Q. Does the existence of these ratemaking mechanisms reduce the Company's level of risk vis a vis the companies in the proxy group?

A. No. A significant portion of the Company's future spending will require a base rate case filing for recovery. Further, the presence of these mechanisms is certainly a positive aspect of New Jersey regulation, but they have become quite commonplace in utility regulation. In fact, as shown in Schedule AEB-10 approximately 63 percent of the companies in the proxy group have implemented infrastructure replacement recovery mechanisms. In addition, approximately 48 percent of the proxy group companies set rates based on forecasted test years. Consequently the presence of the IIP mechanism and Green Programs charge, while positive regulatory mechanisms, do not reduce the Company's risk vis-à-vis that of the proxy group.

Q. What are your conclusions regarding the effect of Public Service's capital spending program on its risk profile and cost of capital?

A. The Company's capital expenditure requirements as a percentage of net utility plant are significant and will continue over the next few years. Additionally, similar to a number of the operating subsidiaries of the proxy group, Public Service does have capital tracking mechanisms to recover some of the Company's projected capital expenditures.

C. Regulatory Risk

Q. How does the regulatory environment affect investors' risk assessments?

A. The ratemaking process is premised on the principle that, for investors and companies to commit the capital needed to provide safe and reliable utility service, the subject utility must have the opportunity to recover the return of, and the market-required return on, invested capital. Regulatory authorities recognize that because utility operations are capital intensive, regulatory

decisions should enable the utility to attract capital at reasonable terms; doing so balances the long-term interests of investors and customers. To achieve this balance, the Company must be able to finance its operations assuming a reasonable opportunity to earn an appropriate return on invested capital to maintain an acceptable financial profile. In that respect, the regulatory environment is one of the most important factors considered in both debt and equity investors' risk assessments.

From the perspective of debt investors, the authorized return should enable the Company to generate the cash flow needed to meet its near-term financial obligations, make the capital investments needed to maintain and expand its systems, and maintain the necessary levels of liquidity to fund unexpected events. This financial liquidity must be derived not only from internally generated funds, but also by efficient access to capital markets. Moreover, because fixed income investors have many investment alternatives, even within a given market sector, the Company's financial profile must be adequate on a relative basis to ensure its ability to attract capital under a variety of economic and financial market conditions.

Equity investors, on the other hand, require that the authorized return be adequate to provide a risk-comparable return on the equity portion of the Company's capital investments. Because equity investors are the residual claimants on the Company's cash flows (which is to say that the equity return is subordinate to interest payments), they are particularly concerned with the strength of regulatory support and its effect on future cash flows.

Q. How do credit rating agencies consider regulatory risk in establishing a company's credit rating?

A. Both S&P and Moody's consider the overall regulatory framework in establishing credit ratings. Moody's establishes credit ratings based on four key factors: (1) regulatory framework; (2) the ability to recover costs and earn returns; (3) diversification; and (4) financial strength,

liquidity, and key financial metrics. Of these criteria, regulatory framework, and the ability to recover costs and earn returns are each given a broad rating factor of 25.00 percent. Therefore, Moody's assigns regulatory risk a 50.00 percent weighting in the overall assessment of business and financial risk for regulated utilities.[47]

S&P also identifies the regulatory framework as an important factor in credit ratings for regulated utilities, stating: "One significant aspect of regulatory risk that influences credit quality is the regulatory environment in the jurisdictions in which a utility operates."[48] S&P identifies four specific factors that it uses to assess the credit implications of the regulatory jurisdictions of investor-owned regulated utilities: (1) regulatory stability; (2) tariff-setting procedures and design; (3) financial stability; and (4) regulatory independence and insulation.[49]

Q. How does the regulatory environment in which a utility operates affect its access to and cost of capital?

A. The regulatory environment can significantly affect both the access to, and cost of capital in several ways. First, the proportion and cost of debt capital available to utility companies are influenced by the rating agencies' assessment of the regulatory environment. As noted by Moody's, "[f]or rate regulated utilities, which typically operate as a monopoly, the regulatory environment and how the utility adapts to that environment are the most important credit considerations."[50] Moody's further highlighted the relevance of a stable and predictable regulatory environment to a utility's credit quality, noting: "[b]roadly speaking, the Regulatory Framework is the foundation for how all the decisions that affect utilities are made (including the setting of

49 *Id*.

50 Moody's Investors Service, Rating Methodology: Regulated Electric and Gas Utilities, June 23, 2017, at 6.

rates), as well as the predictability and consistency of decision-making provided by that foundation."[51]

Q. Have you conducted any analysis of the risk associated with the regulatory framework in New Jersey relative to the jurisdictions in which the utility operating subsidiaries of the companies in your proxy group operate?

A. Yes. I have evaluated the regulatory framework in New Jersey on three factors that are important in terms of providing a regulated utility a reasonable opportunity to earn its authorized ROE: (1) test year convention (i.e., forecast vs. historical); (2) use of rate design or other mechanisms that mitigate volumetric risk and stabilize revenue; and (3) prevalence of capital cost recovery between rate cases. The results of this regulatory risk assessment are shown in Schedule AEB-10 and are summarized as follows:

Test Year Convention: The Company uses partially forecast test year, which will be fully historical by the time a rate decision is issued in the current proceeding. However, approximately 44.30 percent of the utility operating subsidiaries of the companies in the proxy group use a fully forecasted test year, which will not be historical by the time of the rate decision.

Revenue Stabilization / Volumetric Risk: The Company does have partial protection against volumetric risk in New Jersey for its electric and natural gas operations. Public Service has a Conservation Incentive Program ("CIP") surcharge which allows for the recovery of lost sales revenue from the reduction in usage associated with energy efficiency programs and the recovery/refund of other deviations in sales due to, for example, variations in weather. As shown in Schedule AEB-10, approximately 57.0 percent of the operating companies held by the proxy group have some form of revenue stabilization either through straight fixed variable rate design, a formula rate plan, or other mechanisms.

[51] *Id*.

Capital Cost Recovery: As discussed above, the Company has capital tracking mechanisms (i.e., IIP mechanism and Green Programs charge) to recover a portion of capital investment costs between rate cases. This is consistent with the proxy group where 63.3 percent of the operating companies held by the proxy group have some form of capital cost recovery mechanism in place.

Q. Have you developed any additional analyses to evaluate the regulatory environment in New Jersey as compared to the jurisdictions in which the companies in your proxy group operate?

A. Yes. I have conducted two additional analyses to compare the regulatory framework of New Jersey to the jurisdictions in which the utility operating subsidiaries of the proxy group operate. Specifically, I considered two different rankings: (1) the Regulatory Research Associates ("RRA") ranking of regulatory jurisdictions, which is presented in Schedule AEB-11; and (2) S&P's ranking of the credit supportiveness of regulatory jurisdictions, which is presented in Schedule AEB-12.

Q. Please explain how RRA evaluates the regulatory environment in each jurisdiction.

A. RRA evaluates the regulatory environment from an investor perspective, considering the relative regulatory risk associated with ownership of securities issued by the companies that are regulated in each jurisdiction. RRA considers several factors that affect the regulatory process including gubernatorial, legislative and court activity, rate case decisions and other regulatory decisions, and information obtained through contact with commissioners, staff, company and government outreach.

Q. Please explain how you used the RRA Rankings to compare the regulatory jurisdictions of the utility operating subsidiaries of the proxy group companies relative to the Company?

A. RRA assigns a ranking for each regulatory jurisdiction between "Above Average/1" to "Below Average/3," with nine total rankings between these categories. I applied a similar numeric ranking system to the RRA rankings with "Above Average/1" assigned the highest ranking ("1") and "Below Average/3" assigned the lowest ranking ("9"). As shown on Schedule AEB-11, the Company's jurisdictional ranking is "7" or "Below Average/1", which is below the proxy group's average numeric ranking of "4.75" from RRA, which is between "Average/1" and "Average/2."

Q. What information does RRA provide about how it determined a Below Average/1 rating for New Jersey regulation?

A. RRA states that from an investor perspective, the regulatory environment in New Jersey is restrictive and regulatory issues are highly politicized. Further, RRA notes that recently authorized ROEs are below prevailing industry averages and the use of a historical test year results and the inability to include construction work in progress in rate base impede the ability for companies to earn their authorized return. Additionally, RRA noted that New Jersey had a legislatively mandated moratorium on termination of service for non-payment of service during the pandemic that extended through March 15, 2022.[52] The deferrals resulting from this moratorium have not yet been resolved. RRA estimated the magnitude of the deferrals statewide at $710 million through the end of December 2020, however the legislatively mandated moratorium extended through March 15, 2022. The extensive lag and uncertainty of the recovery of these costs represents a significant risk factor from an investor perspective.

[52] Subsequent to RRA's report, the BPU extended the moratorium through March 15, 2023 for residential customers.

Q. How did you conduct your analysis of the S&P credit supportiveness?

A. For credit supportiveness, S&P classifies each regulatory jurisdiction into five categories that range from "Credit Supportive" to "Most Credit Supportive." My analysis of the credit supportiveness of the regulatory jurisdictions in which the proxy companies operate relative to the Company's regulatory jurisdiction is similar to the analysis of the RRA overall regulatory ranking just discussed. Specifically, I assign a numerical ranking to each of S&P's categories, from Most Credit Supportive ("1") to Credit Supportive ("5"). As shown in Schedule AEB-12, the proxy group average ranking is 2.58, which would be classified between "Very Credit Supportive" and "Highly Credit Supportive," while Public Service's rank is lower at "More Credit Supportive" ("4"), which suggests that investors perceive regulation for the Company as below average relative to the proxy group.

Q. What is your conclusion regarding the regulatory framework in New Jersey as compared with the jurisdictions in which the proxy group companies operate?

A. The regulatory framework in which a regulated utility provides service is one of the most important considerations for debt and equity investors. Based on my analysis, I conclude that the regulatory risk for Public Service is higher than for the proxy group, which reflects that the New Jersey regulatory framework has somewhat greater risk than the jurisdictions in which the utility operating subsidiaries of the proxy group companies provide service. This conclusion is reflective of the proxy group generally having more timely cost recovery than the Company and the Company having an S&P credit supportive ranking and RRA ranking that is below the average for the proxy group.

VIII. CAPITAL STRUCTURE AND PROPOSED INTEREST COST RECONCILIATION DEFERRAL

A. Capital Structure

Q. Is the capital structure of a company an important consideration in the determination of the appropriate ROE?

A. Yes, it is. The equity ratio is the primary indicator of financial risk for a regulated utility such as Public Service. Assuming other factors equal, a higher debt ratio increases the risk to equity investors. For debt holders, higher debt ratios result in a greater portion of the available cash flow being required to meet debt service, thereby increasing the risk associated with the payments on debt. The result of increased risk is a higher interest rate. The incremental risk of a higher debt ratio is more significant for common equity shareholders, whose claim on the cash flow of the Company is secondary to debt holders. Therefore, the greater the debt service requirement, the less cash flow is available for common equity holders. To the extent the equity ratio is reduced, it is necessary to increase the authorized ROE to compensate investors for the greater financial risk associated with a lower equity ratio.

Q. What is Public Service's proposed capital structure?

A. As discussed in the Direct Testimony of Company Witness Mr. McFadden, the Company is proposing to establish a capital structure consisting of 55.50 percent common equity, 44.29 percent long-term debt, and 0.21 percent customer deposits.

Q. Did you conduct any analysis to determine if this requested equity ratio was reasonable?

A. Yes. I reviewed the Company's proposed capital structure relative to the actual capital structures of the utility operating subsidiaries of the companies in the proxy group. Since the ROE is set based on the return that is derived from the risk-comparable proxy group, it is reasonable to

look to the average capital structure for the proxy groups to benchmark the equity ratios for the Company.

Q. Please discuss your analysis of the capital structures of the proxy group companies.

A. Specifically, I calculated the average proportion of common equity, long-term debt, and preferred equity for the most recent two years (i.e., eight quarters) for each of the companies in the proxy group at the operating subsidiary level. Schedule AEB-13 summarizes the actual capital structures of the operating subsidiaries. As shown, the two-year average equity ratios for the operating subsidiaries of the proxy group range from 47.21 percent to 66.21 percent. Public Service's proposed equity ratio of 55.5 percent is within the range established by the capital structures of the utility operating subsidiaries of the proxy group.

Q. Are there other factors to be considered in setting the Company's capital structure?

A. Yes, there are other factors that should be considered in setting the Company's capital structure, namely the challenges that the credit rating agencies have highlighted as placing pressure on the credit metrics for utilities.

For example, while Moody's recently revised its outlook for the utility sector from "negative" to "stable", Moody's continues to note that high interest rates and increased capital spending will place pressure on credit metrics. Thus, Moody's highlights constructive regulatory outcomes that promote timely cost recovery as a key factor in supporting utility credit quality.[53]

Fitch Ratings ("Fitch") also highlights similar factors identified by Moody's as challenging utilities' outlook for 2023, stating that the sector faces mounting cost pressures due to "elevated

[53] Moody's Investors Service, Outlook. "Outlook turns stable on low prices and credit-supportive regulation." September 7, 2023.

commodity prices, inflationary headwinds and rising interest costs," and that some offset in managing these headwinds include "higher authorized ROEs and the use of tools such as securitization of under-recovered fuel balances."[54]

Likewise, while S&P also recently revised its outlook for the industry from negative to stable, S&P continues to see significant risks over the near-term for the industry as a result of inflation and increased levels of capital spending. Specifically, S&P noted:

> Despite the improvement in economic data, we expect inflation, rising interest rates, higher capital spending, and the strategic decision by many companies to operate with only minimal financial cushion from their downgrade thresholds to continue to pressure the industry's credit quality. Throughout 2022 and so far in 2023, the Federal Reserve has consistently raised interest rates to reduce the pace of inflation. While these actions appear to have had a positive effect on slowing inflation, there's still been a modest weakening in the industry's financial measures because of inflation and rising interest rates. An environment of continuously rising costs tends to weaken the industry's financial measures because of the timing difference between when the higher costs are incurred and when they are ultimately recovered from ratepayers.[55]

The credit ratings agencies' continued concerns over the negative effects of inflation and increased capital expenditures underscore the importance of maintaining adequate cash flow metrics for the industry as a whole, and Public Service in particular in the context of this proceeding.

Q. Why is this important in the consideration of the Company's capital structure?

A. The amount of debt in the capital structure decreases the financial flexibility of the company due to the fixed payment requirements of the debt service obligations. Therefore, in order to

[54] Fitch Ratings. "North American Utilities, Power & Gas Outlook 2023." December 7, 2022, at 1-2.

[55] S&P Global Ratings. "The Outlook for North American Regulated Utilities Turns Stable," May 18, 2023, at 8.

maintain or improve cash flow metrics, the credit rating agencies have historically supported increasing the equity ratio, which reduces fixed payments and improves cash flow coverage ratios.

Q. What is your conclusion with regard to the Company's proposed capital structure?

A. Considering the actual capital structures of the proxy group operating companies, I believe that Public Service's proposed common equity ratio of 55.5 percent is reasonable. The proposed equity ratio is well within the range established by the capital structures of the utility operating subsidiaries of the proxy companies.

B. Interest Cost Reconciliation Deferral Mechanism

Q. Please explain the Company's proposed interest cost reconciliation deferral mechanism.

A. As discussed in the Direct Testimony of Public Service witness Mr. McFadden, the Company will need to refinance existing debt after the end of the test year; however, given that current interest rates *(i.e.,* 30-day average yield on the Moody's A-rated utility bond as of October 31,2023 was 6.20 percent)[56] exceed Public Service's embedded cost of long-term debt of 3.96 percent, the Company's interest expense will likely exceed that which can be recovered in rates during the first year that rates will go into effect. Therefore, the Company is proposing a new interest cost reconciliation deferral mechanism to defer the difference between the actual embedded cost of debt and the rate approved by the Board in this proceeding. The deferral mechanisms will only account for changes in the Company's embedded cost of debt associated with refinancing existing debt and will not reflect changes in the cost of debt associated with new issuances. The proposed deferral mechanism would be fully symmetric. Therefore, the deferral

[56] Source: Bloomberg Professional.

mechanism would ensure the Company recovers no more or less than its allowed interest expense and can be reevaluated in a future base rate case.

Q. Why is an interest cost reconciliation deferral mechanism appropriate?

A. There has been significant volatility in long-term interest rates over the past few years. For example, the 30-year Treasury yield reached a low of 0.99 percent in March 2020, but has since significantly increased as a result of the change in market conditions discussed in Section IV of my Direct Testimony. As noted above, the 30-day average yield on the 30-year Treasury bond as of October 31, 2023 was 4.84 percent, a more than four-fold increased from March 2020. The volatility in interest rates increases the likelihood that the Company's actual embedded cost of debt during the period that rates will be in effect will be either lower or higher than the embedded cost of debt approved by the Board in this proceeding. Further, the Company does not have any control over interest rates, which are set by the market and influenced by the monetary policy of the Federal Reserve. The deferral mechanism would ensure that customers only pay the actual cost of debt. Therefore, under this mechanism neither customers nor the Company is disadvantaged by changes in the market rate on the debt that is refinanced.

IX. CONCLUSIONS AND RECOMMENDATION

Q. What is your conclusion regarding a fair ROE for the Company?

A. Based on the various quantitative analyses summarized in Figure 12 and the qualitative analyses presented in my Direct Testimony, a reasonable range of ROE results for Public Service is from 10.00 percent to 11.00 percent. Within that range, I believe that the Company's requested ROE of 10.40 percent is conservative considering the Company's excellent management performance, current conditions in capital markets including the high interest rates, and elevated

inflationary pressures, both of which increase the cost of capital as well as the relative business and financial risk of Public Service as compared to the proxy group.

Figure 12: Summary of Results

Constant Growth DCF

Q. What is your conclusion regarding Public Service's proposed capital structure?

A. My conclusion is that Public Service's proposed rate-making capital structure consisting of 55.50 percent common equity, 44.29 percent long-term debt, and customer deposits of 0.21 percent is reasonable as compared to the proxy group companies and should be used for setting rates in this case.

Q. Does this conclude your Direct Testimony?

A. Yes, it does.

Ann E. Bulkley

PRINCIPAL

Boston 508.981.0866 Ann.Bulkley@brattle.com

With more than 25 years of experience in the energy industry, Ms. Bulkley specializes in regulatory economics for the electric and natural gas sectors, including rate of return, cost of equity, and capital structure issues.

Ms. Bulkley has extensive state and federal regulatory experience, and she has provided expert testimony on the cost of capital in nearly 100 regulatory proceedings before 32 state regulatory commissions and the Federal Energy Regulatory Commission (FERC).

In addition to her regulatory experience, Ms. Bulkley has provided valuation and appraisal services for a variety of purposes, including the sale or acquisition of utility assets, regulated ratemaking, ad valorem tax disputes, and other litigation purposes. In addition, she has experience in the areas of contract and business unit valuation, strategic alliances, market restructuring, and regulatory and litigation support.

Ms. Bulkley is a Certified General Appraiser licensed in the Commonwealth of Massachusetts and the State of New Hampshire.

Prior to joining Brattle, Ms. Bulkley was a Senior Vice President at an economic consultancy and held senior positions at several other consulting firms.

SELECTED CONSULTING EXPERIENCE & EXPERT TESTIMONY

REGULATORY ANALYSIS AND RATEMAKING

Have provided a range of advisory services relating to regulatory policy analysis and many aspects of utility ratemaking, with specific services including:

- Cost of capital and return on equity testimony, cost of service and rate design analysis and testimony, development of ratemaking strategies
- Development of merchant function exit strategies

- Analysis and program development to address residual energy supply and/or provider of last resort obligations
- Stranded costs assessment and recovery
  Performance-based ratemaking analysis and design
- Many aspects of traditional utility ratemaking (e.g., rate design, rate base valuation)

COST OF CAPITAL

Have provided expert testimony on the cost of capital and capital structure in nearly 100 regulatory proceedings before state and federal regulatory commissions in the United States.

RATEMAKING

Have assisted several clients with analysis to support investor-owned and municipal utility clients in the preparation of rate cases. Sample engagements include:

- Assisted several investor-owned and municipal clients on cost allocation and rate design issues including the development of expert testimony supporting recommended rate alternatives.
- Worked with Canadian regulatory staff to establish filing requirements for a rate review of a newly regulated electric utility. Along with analyzing and evaluating rate application, attended hearings and conducted investigation of rate application for regulatory staff. And prepared, supported, and defended recommendations for revenue requirements and rates for the company. Additionally, developed rates for gas utility for transportation program and ancillary services.

VALUATION

Have provided valuation services to utility clients, unregulated generators, and private equity clients for a variety of purposes, including ratemaking, fair value, ad valorem tax, litigation and damages, and acquisition. Appraisal practices are consistent with the national standards established by the Uniform Standards of Professional Appraisal Practice.

Representative projects/clients have included:

- Prepared appraisals of electric utility transmission and distribution assets for ad valorem tax purposes.
- Prepared appraisals of several hydroelectric generating facilities for ad valorem tax purposes.
- Conducted appraisals of fossil fuel generating facilities for ad valorem tax purposes.
- Conducted appraisals of generating assets for the purposes of unwinding sale-leaseback agreements.
- For a confidential utility client, prepared valuation of fossil and nuclear generation assets for financing purposes for regulated utility client.

- Prepared a valuation of a portfolio of generation assets for a large energy utility to be used for strategic planning purposes. Valuation approach included an income approach, a real options analysis, and a risk analysis.
- Assisted clients in the restructuring of NUG contracts through the valuation of the underlying assets. Performed analysis to determine the option value of a plant in a competitively priced electricity market following the settlement of the NUG contract.
- Prepared market valuations of several purchase power contracts for large electric utilities in the sale of purchase power contracts. Assignment included an assessment of the regional power market, analysis of the underlying purchase power contracts, and a traditional discounted cash flow valuation approach, as well as a risk analysis. Analyzed bids from potential acquirers using income and risk analysis approached. Prepared an assessment of the credit issues and value at risk for the selling utility.
- Prepared appraisal of a portfolio of generating facilities for a large electric utility to be used for financing purposes.
- Prepared fair value rate base analyses for Northern Indiana Public Service Company for several electric rate proceedings. Valuation approaches used in this project included income, cost, and comparable sales approaches.
- Prepared an appraisal of a fleet of fossil generating assets for a large electric utility to establish the value of assets transferred from utility property.
- Conducted due diligence on an electric transmission and distribution system as part of a buy-side due diligence team.
- Provided analytical support for and prepared appraisal reports of generation assets to be used in ad valorem tax disputes.
- Provided analytical support and prepared testimony regarding the valuation of electric distribution system assets in five communities in a condemnation proceeding.
- Prepared feasibility reports analyzing the expected net benefits resulting from municipal ownership of investor-owned utility operations.
- Prepared independent analyses of proposal for the proposed government condemnation of the investor-owned utilities in Maine and the formation of a public power district.
- Valued purchase power agreements in the transfer of assets to a deregulated electric market.

STRATEGIC AND FINANCIAL ADVISORY SERVICES

Have assisted several clients across North America with analytically-based strategic planning, due diligence, and financial advisory services.

Representative projects include:

- Preparation of feasibility studies for bond issuances for municipal and district steam clients.
- Assisted in the development of a generation strategy for an electric utility. Analyzed various NERC regions to identify potential market entry points. Evaluated potential competitors and alliance partners. Assisted in the development of gas and electric price forecasts. Developed a framework for the implementation of a risk management program.
- Assisted clients in identifying potential joint venture opportunities and alliance partners. Contacted interviewed and evaluated potential alliance candidates based on company-established criteria for several LDCs and marketing companies. Worked with several LDCs and unregulated marketing companies to establish alliances to enter into the retail energy market. Prepared testimony in support of several merger cases and participated in the regulatory process to obtain approval for these mergers.
- Assisted clients in several buy-side due diligence efforts, providing regulatory insight and developing valuation recommendations for acquisitions of both electric and gas properties.

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
MICHAEL J. ADAMS
SENIOR VICE PRESIDENT, CONCENTRIC ENERGY ADVISORS, INC.

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Michael J. Adams. My business address is 293 Boston Post Road West, Suite 500, Marlborough, Massachusetts 01752.

Q. By whom are you employed?

A. I am a Senior Vice President with Concentric Energy Advisors, Inc. ("Concentric").

Q. Please describe your educational background and experience.

A. A summary of my educational background and experience is set forth in Appendix A to my testimony.

Q. On whose behalf are you appearing in this proceeding?

A. I am submitting this direct testimony on behalf of Public Service Electric and Gas Company ("PSE&G" or "the Company").

Q. What is the purpose of your direct testimony?

A. I was retained by the Company to prepare benchmarking analyses evaluating the financial and operational performance of PSE&G's electric and gas business operations.

Q. Please describe the nature of the analyses that you performed to assess PSE&G's performance.

A. I benchmarked PSE&G's electric business performance related to cost control, reliability and customer satisfaction against four peer groups to assess the Company's performance. Similarly, PSE&G's gas business performance related to cost control and customer satisfaction was benchmarked against four peer groups of comparable companies. The peer group analyses evaluated PSE&G's performance against national, regional, and New Jersey regulated utilities, as well as the operating companies included in Company witness Bulkley's return on equity peer group.

Q. Please generally summarize your findings and conclusions based upon the results of the benchmarking analyses.

A. Overall, I found that both PSE&G's electric and gas businesses performed very well when compared to its peer groups, which indicates a well-managed company that is effectively focused on controlling costs while providing high levels of reliability and customer satisfaction.

Q. How are you proposing that the results of your benchmarking analyses be used in this rate proceeding?

A. I believe it is reasonable for the Board of Public Utilities (the "Board" or the "BPU") to consider the Company's performance in areas such as fiscal responsibility, operational performance, service quality and customer satisfaction when establishing the authorized rate of return for the Company. Given PSE&G's strong performance in each of these areas, in my opinion, it is appropriate for the BPU to set PSE&G's ROE at the upper end of the range of

return on equity in recognition of the Company's consistently strong cost control, operational performance, service quality and customer satisfaction.

Q. Are you sponsoring any exhibits with your direct testimony?

A. Yes. I am sponsoring PSE&G Schedules MJA-B-1 through MJA-B-25 which are identified below and discussed in my testimony.

Schedules	Description
MJA-B-1	Electric Peer Group Composition
MJA-B-2	Gas Peer Group Composition
MJA-B-3	Distribution Operations and Maintenance ("O&M") expense per electric customer
MJA-B-4	Distribution O&M per MWh sold
MJA-B-5	Administrative and General ("A&G") expense per electric customer
MJA-B-6	A&G expense per MWh sold
MJA-B-7	Salaries, Wages, Pensions, and Benefits expense per employee
MJA-B-8	Total O&M (excluding transmission and production) expense per electric customer
MJA-B-9	Total O&M (excluding transmission and production) expense per MWh sold
MJA-B-10	Distribution O&M expense per gas customer
MJA-B-11	Distribution O&M per Mcf sold
MJA-B-12	A&G expense per gas customer
MJA-B-13	A&G expense per Mcf sold
MJA-B-14	Total Non-Production O&M expense per gas customer
MJA-B-15	Total Non-Production O&M expense per Mcf sold
MJA-B-16	SAIDI – NJ Companies
MJA-B-17	SAIFI – NJ Companies
MJA-B-18	CAIDI – NJ Companies
MJA-B-19	SAIFI – IEEE
MJA-B-20	CAIDI – IEEE
MJA-B-21	SAIDI – IEEE
MJA-B-22	J.D. Power - Residential Electric Customers
MJA-B-23	J.D. Power - Business Electric Customers
MJA-B-24	J.D. Power - Residential Gas Customers
MJA-B-25	J.D. Power - Business Gas Customers

II. SOURCE DATA

Q. What years were included in the benchmarking analyses?

A. I used the most current publicly available information for PSE&G and the peer companies at the time the analyses were prepared in the second half of 2023. For both the electric and gas businesses, information for the calendar years 2013 through 2022 was used for the benchmarking analyses.

Q. Against what peer groups did you benchmark PSE&G's electric business operations?

A. PSE&G was benchmarked against four separate peer groups. The "Electric Group" included all operating companies classified by S&P Capital IQ Pro as "Electric Utility" or "Diversified Utility" which owned no regulated generation, and had a customer count of more than 500,000. The "Electric Group" included 25 companies in each year of the analyses.[1]

The "Regional Group" included all companies in the "Electric Group" having electric distribution operations in Connecticut, Delaware, Maryland, New Jersey, New York, or Pennsylvania. The "Regional Group" included 16 companies for each year of the analyses.

The "New Jersey Group" included all companies with electric distribution operations in New Jersey. The "New Jersey Group" included four companies for each year of the analyses.

The Return on Equity ("ROE") proxy group included all operating companies classified by S&P Capital IQ Pro as "Electric Utility" or "Diversified Utility" which owned no regulated

[1] The number of companies benchmarked in the Salaries, Wages, Pensions, and Benefits expense per employee analysis is slightly lower for each proxy group due to lack of available data.

generation and were owned by the holding companies in the proxy group included in Company witness Bulkley's cost of capital recommendation. The "ROE Proxy Group" included 11 companies for each year of the analyses.

The companies included in each electric peer group are set forth on Schedule MJA-B-1.

Q. What companies were included in the benchmarking of PSE&G's gas business?

A. PSE&G's gas business was benchmarked against four separate peer groups. The "LDC Group" included all natural gas distribution companies with a customer count of more than 500,000. The LDC Group included 41 companies.[2]

The "Regional Group" included all companies in the "LDC Group" having natural gas distribution operations in Connecticut, Delaware, Maryland, New Jersey, New York, or Pennsylvania. There were 11 companies in the Regional Group.

The "New Jersey Group" included all companies with natural gas distribution operations in New Jersey. The "New Jersey Group" included four companies for each year of the analyses.

The Return on Equity ("ROE") proxy group included all natural gas distribution companies that were owned by the holding companies in the proxy group included in Company witness Bulkley's cost of capital recommendation. The "ROE Proxy Group" included 44 companies.[3]

[2] The number of companies included in the analysis varied between 34 to 41 due to data availability for certain metrics in certain years.

[3] The number of companies included in the analysis varied between 25 to 44 due to data availability for certain metrics in certain years.

The companies included in the gas company peer groups are set forth in Schedule MJA-B-2.

Q. Is the information that you used to benchmark PSE&G's electric and gas operations publicly available?

A. Yes. All of the information that was used in the benchmarking analyses was obtained from publicly available sources. The data relied upon for my analyses was obtained from the Federal Energy Regulatory Commission ("FERC"), the Energy Information Administration ("EIA"), the Institute of Electrical and Electronics Engineers ("IEEE"), and JD Power.

Q. What modifications were made to the data contained in the publicly available information to complete the benchmarking analyses?

A. No modifications were made to the data obtained from the referenced sources.[4] To ensure that the data was comparable across companies, each metric was compared on a cost per customer basis (i.e., the reported expense level was divided by the reported total number of customers) or a per unit sold basis (i.e., per mega-watt hour ("MWh") sold for the electric business or per million cubic feet ("Mcf") sold for the gas business).

[4] The A&G benchmarking analysis excluded amounts booked to FERC Account 926 (Employee Pensions and Benefits) because of the volatile nature of this account and the balances reported oscillating between positive and negative values. In light of PSE&G's pension and OPEB income in recent years, this adjustment is conservative.

III. ELECTRIC BENCHMARKING ANALYSES

Q. What metrics did you use to evaluate PSE&G's operational performance against that of the peer companies?

A. The following metrics were used to evaluate PSE&G's electric business cost performance against that of its peer companies:

1. Distribution Operations and Maintenance ("O&M") expense per electric customer;
2. Distribution O&M per MWh sold;
3. Administrative and General ("A&G") expense per electric customer;
4. A&G expense per MWh sold;
5. Salaries, Wages, Pensions, and Benefits expense per employee;
6. Total O&M (excluding transmission and production) expense per electric customer;[5] and
7. Total O&M (excluding transmission and production) expense per MWh sold.

Q. Please explain why it is appropriate to evaluate PSE&G's performance based upon the metrics set forth above.

A. The items that most directly impact customers' perceptions and experiences with their utility company revolve around costs (which are a driver of rates), service reliability, and how well the utility responds when the customer has an issue pertaining to their service. For that reason, I chose the metrics that I believe best illustrate PSE&G's performance in each of the above areas. The cost metrics were evaluated both on a cost per customer basis and a cost per

[5] Total O&M equals Distribution O&M plus A&G expense.

unit sold basis (i.e., per MWh for the electric business and per Mcf for the gas business). The service reliability and customer satisfaction metrics are discussed later in my testimony.

Q. How did PSE&G perform when compared to its peer companies on a distribution O&M expense per electric customer basis?

A. As shown on Schedule MJA-B-3, PSE&G's distribution O&M per customer ranged from a low of $73.70 in 2013 to a high of $87.26 in 2018. The Electric Group mean ranged from a low of $111.41 in 2013 to a high of $172.26 in 2022. The Regional Group mean ranged from a low of $115.83 in 2013 to a high of $186.82 in 2022. The New Jersey Group mean ranged from a low of $120.08 in 2013 to a high of $233.52 in 2020. The ROE Proxy Group mean ranged from a low of $151.90 in 2013 to a high of $185.36 in 2022. Therefore, PSE&G's electric distribution O&M expense per customer was consistently below (i.e., performed better than) the group means for each of the four comparison groups.

The cumulative average growth rate ("CAGR") of PSE&G's electric distribution O&M expenses per customer over the 10-year period examined was 0.32 percent. The Electric Group's CAGR over the same period was 4.96 percent, while the Regional Group's was 5.46 percent. The New Jersey Group's CAGR was 6.72 percent, while the ROE Proxy Group's was 2.24 percent. Therefore, in each comparison, PSE&G's electric distribution O&M expenses increased at a significantly lower rate over the period examined than those of the peer groups.

In 2022, PSE&G's electric distribution O&M expense per customer of $75.86 was approximately 56 percent lower than the Electric Group mean; 59 percent lower than the Regional Group mean; 65 percent lower than the New Jersey Group mean; and 59 percent lower than the ROE Proxy Group mean.

Q. How did PSE&G perform when compared to the peer companies on a distribution expense per MWh basis?

A. As shown on Schedule MJA-B-4, PSE&G's electric distribution O&M expense per MWh sold ranged from a low of $3.92 in 2013 to a high of $4.78 in 2020 over the ten-year period. The Electric Group mean ranged from a low of $5.76 in 2013 to a high of $11.04 in 2022 over the same period. The Regional Group mean ranged from a low of $5.93 in 2013 to a high of $10.71 in 2022 over the ten-year period. The New Jersey Group mean ranged from a low of $6.10 in 2013 to a high of $13.38 in 2020. The ROE Proxy Group mean ranged from a low of $7.09 in 2013 to a high of $12.77 in 2021. Therefore, PSE&G's electric distribution O&M expense per megawatt-hour sold was consistently below (i.e., performed better than) the group means for each of the four comparison groups.

The CAGR of PSE&G's electric distribution O&M expenses per MWh sold over the 10-year period examined was 1.20 percent. The Electric Group's CAGR over the same period was 7.50 percent, while the Regional Group's was 6.82 percent. The New Jersey Group's CAGR was 6.79 percent, while the ROE Proxy Group's was 6.63 percent. Therefore, PSE&G's electric distribution expense per MWh sold increased at a significantly lower rate over the years examined than that of the peer groups.

In 2022, PSE&G's distribution O&M expense per MWh sold of $4.36 was approximately 60 percent lower than the Electric Group mean; 59 percent lower than the Regional Group mean; 63 percent lower than the New Jersey Group mean; and 66 percent lower than the ROE Proxy Group mean.

Q. Did you compare PSE&G's A&G expense per customer to those of the peer group means?

A. Yes. As shown on Schedule MJA-B-5, PSE&G's A&G expense per customer was well below the group means for each of the four comparison groups, for the time period examined.

PSE&G's A&G expense per customer ranged from a low of $49.12 in 2014 to a high of $71.69 in 2022. The Electric Group mean ranged from a low of $99.62 in 2013 to a high of $130.43 in 2022. The Regional Group mean ranged from a low of $108.05 in 2013 to a high of $129.92 in 2022. The New Jersey Group mean ranged from a low of $95.99 in 2013 to a high of $155.25 in 2022. The ROE Proxy Group mean ranged from a low of $133.23 in 2018 to a high of $167.66 in 2013. Therefore, PSE&G's A&G expense per customer was consistently below (i.e., performed better than) the group means for each of the four comparison groups.

The CAGR of PSE&G's A&G expense per customer over the 10-year period examined was 3.64 percent. The Electric Group's CAGR over the same period was 3.04 percent, while the Regional Group's was 2.07 percent. The New Jersey Group's CAGR was 5.49 percent, while the ROE Proxy Group's was negative 1.38 percent. Therefore, PSE&G's A&G expense per customer increased at a rate higher than those of the Electric, Regional, and ROE groups, and lower than that of the New Jersey group.

In 2022, PSE&G's A&G expense per customer of $71.69 was approximately 45 percent lower than the Electric Group mean; 45 percent lower than the Regional Group mean; 54 percent lower than the New Jersey Group mean; and 52 percent lower than the ROE proxy group mean.

Q. How did PSE&G perform when compared to the peer companies on an A&G expense per MWh basis?

A. As shown on Schedule MJA-B-6, PSE&G's electric A&G expense per MWh sold ranged from a low of $2.65 in 2014 to a high of $4.12 in 2022. The Electric Group mean ranged from a low of $5.35 in 2013 to a high of $8.62 in 2022. The Regional Group mean ranged from a low of $5.68 in 2013 to a high of $7.32 in 2022. The New Jersey Group mean ranged from a low of $4.83 in 2013 to a high of $8.65 in 2022. The ROE Proxy Group mean ranged from a low of $7.04 in 2017 to a high of $9.62 in 2022. Therefore, PSE&G's A&G expense per MWh sold was consistently below (i.e., performed better than) the group means for each of the four comparison groups.

The CAGR of PSE&G's A&G expense per MWh sold over the 10-year period examined was 4.55 percent. The Electric Group's CAGR over the same period was 5.45 percent, while the Regional Group's was 2.87 percent. The New Jersey Group's CAGR was 6.69 percent, while the ROE Proxy Group's was 2.63 percent. PSE&G's A&G expense per MWh sold increased at a rate higher than that of the Regional and ROE Proxy Groups, and lower than those of the Electric and New Jersey groups.

In 2022, PSE&G's A&G expense per MWh sold of $4.12 was approximately 52 percent lower than the Electric Group mean; 44 percent lower than the Regional Group mean; 52 percent lower than the New Jersey Group mean; and 57 percent lower than the ROE Proxy Group mean.

Q. Did you compare PSE&G's salaries, wages, pensions, and benefits expenses on a per employee basis to those of the peer companies?

A. Yes. As shown on Schedule MJA-B-7, PSE&G's salaries, wages, pensions, and benefits expense per employee ranged from a low of $117.95 in 2019 to a high of $129.04 in 2018. The Electric Group mean ranged from a low of $109.34 in 2013 to a high of $154.64 in 2020. The Regional Group mean ranged from a low of $107.60 in 2013 to a high of $150.04 in 2020. The New Jersey Group mean ranged from a low of $80.79 in 2021 to a high of $156.76 in 2014. The ROE Proxy Group mean ranged from a low of $138.21 in 2014 to a high of $200.90 in 2021.

The CAGR of PSE&G's salaries, wages, pensions and benefits expense per employee over the 10-year period examined was negative 0.08 percent. The Electric Group's CAGR over the same period was 3.17 percent, while the Regional Group's was 2.60 percent. The New Jersey Group's CAGR was 1.75 percent, while the ROE Proxy Group's was 3.54 percent. Therefore, PSE&G's salaries, wages, pensions and benefits expense per employee decreased, while those of the Electric, Regional, New Jersey, and ROE groups increased over the years examined.

In 2022, PSE&G's salaries, wages, pensions, and benefits expense per employee of $119.24 was approximately 18 percent lower than the Electric Group mean; 12 percent lower than the Regional Group mean; 8 percent lower than the New Jersey Group mean; and 39 percent lower than the ROE Proxy Group mean.

Q. Is it a notable accomplishment that PSE&G's salaries, wages, pensions, and benefits expenses, on a per employee basis is less than those of its peer companies?

A. Yes. Given that the Northeast traditionally has higher wages than most other parts of the country, I believe it is a notable accomplishment that PSE&G's salaries, wages, pensions, and benefits expenses per employee are below not only that of the Regional and New Jersey group means, but also that of the Electric Group, which includes companies across the country.

Q. How can you support the statement that wages in New Jersey are typically higher than those in most other regions of the country?

A. The Consumer Price Index ("CPI") for Urban Wage Earners and Clerical Workers, as reported by the United States Bureau of Labor Statistics ("BLS") sets forth statistics for the Northeast, Midwest, South and West. The following table presents the reported information as of December 31, 2022 by region:

Region	CPI-Urban Wage Earners and Clerical Workers	Ratio to Northeast
Northeast	305.734	1.000
Midwest	270.656	0.885
South	283.431	0.927
West	306.762	1.003

Q. Did you also compare PSE&G's total electric O&M expense to that of the peer groups?

A. Yes. Given that this is a distribution-only rate proceeding, for comparison purposes, I excluded both production and transmission O&M from the total O&M of each of the companies in the analyses.

Q. How did PSE&G's total O&M (excluding transmission and production expenses) per customer compare to that of the peer companies?

A. As shown on Schedule MJA-B-8, PSE&G's total O&M expense (excluding transmission and production) per customer ranged from a low of $300.34 in 2020 to a high of $397.25 in 2013. The Electric Group mean ranged from a low of $353.77 in 2013 to a high of $454.89 in 2022. The Regional Group mean ranged from a low of $376.45 in 2013 to a high of $473.73 in 2022. The New Jersey Group mean ranged from a low of $449.11 in 2013 to a high of $613.51 in 2020. The ROE Proxy Group mean ranged from a low of $488.76 in 2018 to a high of $548.69 in 2015. Therefore, total O&M expense (excluding transmission and production) per customer was consistently below (i.e., performed better than) the group means for each of the four comparison groups in all years except for 2013.

The CAGR of PSE&G's total O&M expense (excluding transmission and production) per customer over the 10-year period examined was a negative 2.01 percent. The Electric Group's CAGR over the same period was 2.83 percent, while the Regional Group's was 2.59 percent. The New Jersey Group's CAGR was 2.83 percent, while the ROE Proxy Group's was negative 0.48 percent. Therefore, PSE&G's total O&M expense (excluding transmission and production) per customer decreased more than the ROE group's did, while those of the Electric, Regional, and New Jersey groups increased over the years examined.

In 2022, PSE&G's total electric O&M (excluding transmission and production) per customer of $330.89 was approximately 30 percent lower than the Electric Group mean; 27 percent lower than the Regional Group mean; 43 percent lower than the New Jersey Group mean; and 36 percent lower than the ROE Proxy Group mean.

Q. Did the comparison of PSE&G's total O&M expenses (excluding transmission and production) per MWh sold basis produce similar results?

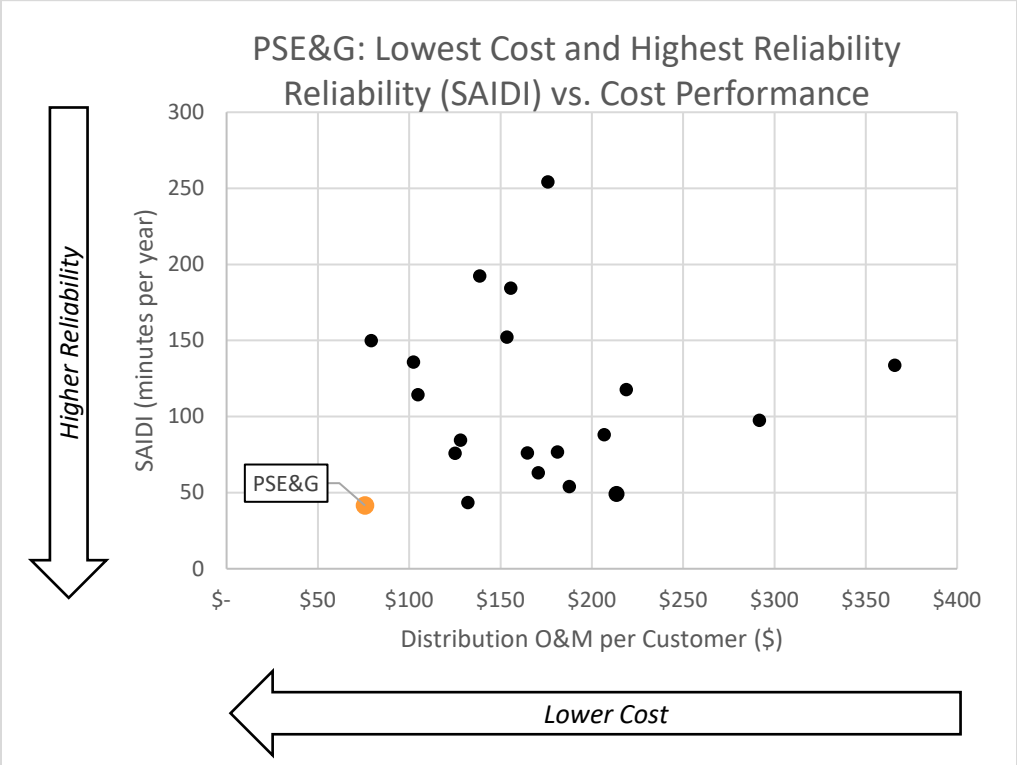
A. Yes. As shown on Schedule MJA-B-9, PSE&G's total electric O&M expenses (excluding transmission and production) per MWh sold ranged from a low of $17.33 in 2019 to a high of $21.11 in 2013. The Electric Group mean ranged from a low of $19.14 in 2013 to a high of $30.42 in 2022. The Regional Group mean ranged from a low of $19.86 in 2013 to a high of $27.63 in 2020. The New Jersey Group mean ranged from a low of $22.50 in 2013 to a high of $35.04 in 2020. The ROE Proxy Group mean ranged from a low of $25.94 in 2016 to a high of $34.67 in 2021. Therefore, PSE&G's total O&M expense (excluding transmission and production) per MWh sold was consistently below (i.e., performed better than) the group means for each of the four comparison groups in all years except for 2013.

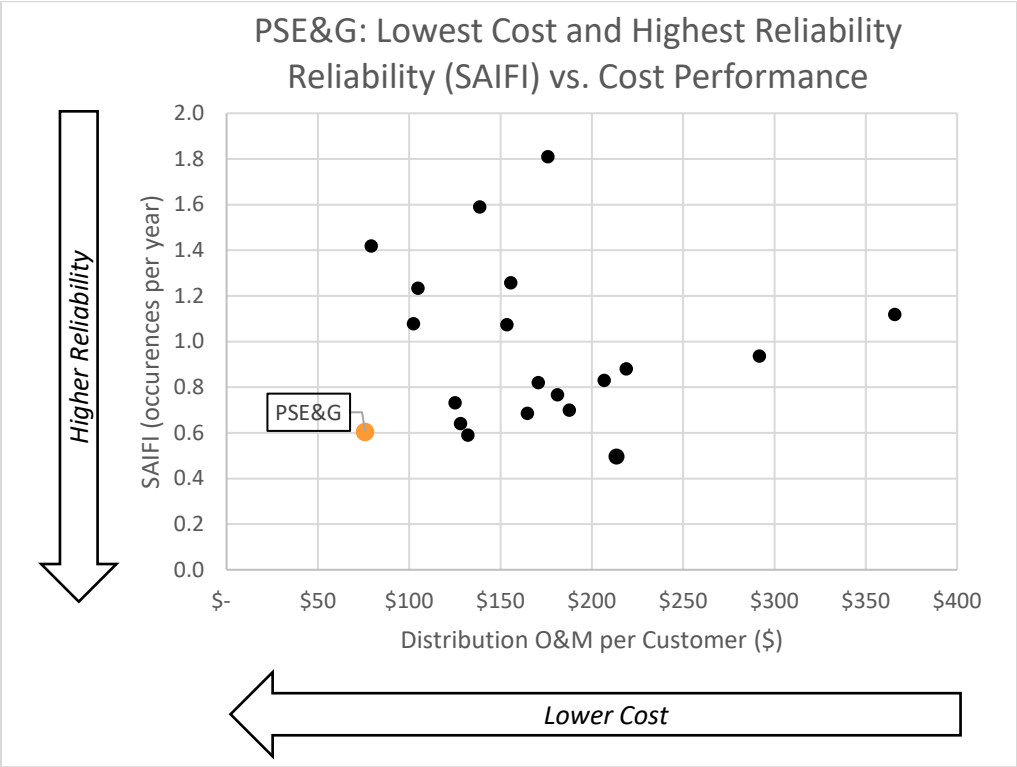
The CAGR of PSE&G's total electric O&M expenses (excluding transmission and production) per MWh over the 10-year period examined was negative 1.15 percent. The Electric Group's CAGR over the same period was 5.28 percent, while the Regional Group's was 3.65 percent. The New Jersey Group's CAGR was 4.03 percent, while the ROE Proxy Group's was 3.03 percent. Therefore, PSE&G's total O&M expense (excluding transmission and production) per MWh decreased, while those of the Electric, Regional, New Jersey, and ROE groups increased over the years examined.

In 2022, PSE&G's total electric O&M expenses (excluding transmission and production) per MWh sold of $19.02 was 37 percent lower than the Electric Group mean; 31 percent lower than the Regional Group mean; 41 percent lower than the New Jersey Group mean; and 44 percent lower than the ROE Proxy Group mean.

Q. Has the Company's reliability performance been negatively impacted as a result of the Company's cost control?

A. No, the Company has been able to manage its cost extremely well without compromising the system reliability. The charts below demonstrate that the Company is able to manage its costs while maintaining high levels of reliability compared to its peers. The reliability benchmarking is discussed in more detail later in my testimony.





IV. GAS BENCHMARKING ANALYSES

Q. Have you also benchmarked the performance of PSE&G's gas operations?

A. Yes, I have.

Q. What metrics did you use to evaluate the operational performance of PSE&G's gas business against that of its peer companies?

A. The following metrics were used to evaluate PSE&G's gas business performance against that of the peer groups:

1. Distribution O&M expense per gas customer;
2. Distribution O&M per Mcf sold;
3. A&G expense per gas customer;

4. A&G expense per Mcf sold;

5. Total Non-Production O&M expense per gas customer; and

6. Total Non-Production O&M expense per Mcf Sold.

Q. Prior to discussing the specific analyses that were prepared, can you discuss how PSE&G's gas business performed when benchmarked against its peer companies?

A. PSE&G's gas business was benchmarked against an LDC Group, a Regional Group, a New Jersey Group, and an ROE Proxy Group. PSE&G and the peer groups were evaluated based upon their respective performance over the most recent 10-year period for which data was publicly available. As will be discussed below, PSE&G's gas business performed well against each of the peer groups.

Q. For what years have you benchmarked PSE&G's gas business performance?

A. PSE&G's gas business performance was benchmarked against its peer companies for the years 2013 through 2022.

Q. How did PSE&G's gas business perform when compared to its peer companies on a distribution O&M expense per customer basis?

A. As shown on Schedule MJA-B-10, PSE&G's gas distribution O&M expense per customer was below (i.e., better than) the group mean for the LDC Group, Regional Group, and the ROE Proxy Group, in each year of the analysis. PSE&G's gas distribution O&M expense per customer was lower than the New Jersey Group mean for all but two years (2018 and 2019) of the ten years examined. PSE&G's gas distribution O&M per gas customer ranged from a low of $43.12 in 2013 to a high of $66.77 in 2018. The LDC Group mean ranged from a low of $74.13 in 2013 to a high of $99.88 in 2018. The Regional Group mean ranged from

a low of $85.68 in 2013 to a high of $129.18 in 2018. The New Jersey Group mean for the gas companies ranged from a low of $48.86 in 2013 to a high of $69.87 in 2021. The ROE Proxy Group mean for the gas companies ranged from a low of $75.32 in 2013 to a high of $89.12 in 2022.

The CAGR of PSE&G's gas distribution O&M expenses per customer over the 10-year period examined was 2.59 percent. The LDC Group's CAGR over the same period was 3.03 percent, while the Regional Group's was 4.35 percent. The New Jersey Group's CAGR was 2.84 percent, while the ROE Proxy Group's was 1.89 percent. Therefore, PSE&G's gas distribution O&M expense per customer increased at a lower rate over the years examined than that of the LDC, Regional, and New Jersey peer groups, and higher than that of the ROE group.

In 2022, PSE&G's gas distribution O&M expense per customer of $54.29 was approximately 44 percent lower than the LDC Group mean; 57 percent lower than the Regional Group mean; 14 percent lower than the New Jersey Group mean; and 39 percent lower than the ROE Proxy Group mean.

Q. How did PSE&G perform when compared to the peer groups on a gas distribution expense per Mcf sold basis?

A. As shown on Schedule MJA-B-11, PSE&G's gas distribution O&M expense per Mcf sold was below (i.e., better than) the mean of each of the four comparison groups in every year of the analysis. PSE&G's gas distribution O&M expense per Mcf sold ranged from a low of $0.25 in 2014 to a high of $0.42 in 2019. The LDC Group mean ranged from a low of $0.48 in 2013 to a high of $0.64 in 2018. The Regional Group mean ranged from a low of $0.56 in 2013 to a high of $0.88 in 2021. The New Jersey Group mean ranged from a low of $0.35 in

2013 to a high of $0.62 in 2020. The ROE Proxy Group mean ranged from a low of $0.45 in 2013 to a high of $0.54 in 2016.

The CAGR of PSE&G's total gas distribution O&M expenses per Mcf sold over the 10-year period examined was 4.53 percent. The LDC Group's CAGR over the same period was 2.98 percent, while the Regional Group's was 4.71 percent. The New Jersey Group's CAGR was 4.67 percent, while the ROE Proxy Group's was 0.53 percent. Therefore, PSE&G's gas distribution O&M expense per Mcf increased at a higher rate than that of the LDC and ROE groups, and at a lower rate than that of the Regional and New Jersey groups.

In 2022, PSE&G's gas distribution O&M expense per Mcf sold of $0.38 was approximately 39 percent lower than the LDC Group mean; 55 percent lower than the Regional Group mean; 28 percent lower than the New Jersey Group mean; and 19 percent lower than the ROE Proxy Group mean.

Q. Did PSE&G compare well on an A&G expense per gas customer basis when compared to the peer groups?

A. Yes. As shown on Schedule MJA-B-12, PSE&G's A&G expense per gas customer was below (i.e., better than) the group mean for each of the four comparison groups in every year of the analysis. PSE&G's A&G expense per gas customer ranged from a low of $31.96 in 2014 to a high of $51.72 in 2022. The LDC Group mean ranged from a low of $63.50 in 2015 to a high of $91.48 in 2022. The Regional Group mean ranged from a low of $82.07 in 2015 to a high of $112.53 in 2022. The New Jersey Group mean ranged from a low of $93.94 in 2020 to a high of $146.50 in 2022. The ROE Proxy Group mean ranged from a low of $75.83 in 2015 to a high of $99.26 in 2022.

The CAGR of PSE&G's A&G expenses per customer over the 10-year period examined was 3.93 percent. The LDC Group's CAGR over the same period was 3.89 percent, while the Regional Group's was 3.55 percent. The New Jersey Group's CAGR was 4.98 percent, while the ROE Proxy Group's was 2.95 percent. Therefore, PSE&G's A&G expense per gas customer increased at a rate lower than that of the New Jersey group, and higher than that of the LDC, Regional, and ROE groups. In 2022, PSE&G's A&G expense per gas customer of $51.72 was approximately 43 percent lower than the LDC Group mean; 54 percent lower than the Regional Group mean; 65 percent lower than the New Jersey Group mean; and 48 percent lower than the ROE Proxy Group mean.

Q. How did PSE&G rank in the comparison of gas A&G expense per Mcf sold?

A. As shown on Schedule MJA-B-13, PSE&G's A&G expense per Mcf sold was below (i.e., better than) the group mean for each of the four comparison groups in every year of the analysis. PSE&G's A&G expense per Mcf sold ranged from a low of $0.17 in 2014 to a high of $0.37 in 2020. The LDC Group mean ranged from a low of $0.43 in 2013 to a high of $0.59 in 2020. The Regional Group mean ranged from a low of $0.52 in 2015 to a high of $0.76 in 2022. The New Jersey Group mean ranged from a low of $0.65 in 2014 to a high of $1.22 in 2022. The ROE Proxy Group mean ranged from $0.45 in 2013 to a high of $0.62 in 2020.

The CAGR of PSE&G's A&G expenses per Mcf sold over the 10-year period examined was 5.89 percent. The LDC Group's CAGR over the same period was 3.68 percent, while the Regional Group's was 4.00 percent. The New Jersey Group's CAGR was 7.21 percent, while the ROE Proxy Group's was 1.98 percent. Therefore, PSE&G's A&G expense per Mcf sold

increased at a rate lower than that of the New Jersey group, and higher than that of the LDC, Regional, and ROE groups.

In 2022, PSE&G's A&G expense per Mcf sold of $0.37 was approximately 38 percent lower than the LDC Group mean; 52 percent lower than the Regional Group mean; 70 percent lower than the New Jersey Group mean; and 32 percent lower than the ROE Proxy Group mean.

Q. How did PSE&G's total non-production O&M per gas customer compare to that of the peer companies?

A. As shown on Schedule MJA-B-14, PSE&G's total non-production O&M expense per gas customer ranged from a low of $181.89 in 2021 to a high of $277.07 in 2013. The LDC Group mean ranged from a low of $261.55 in 2013 to a high of $305.59 in 2022. The Regional Group mean ranged from a low of $325.59 in 2013 to a high of $385.67 in 2022. The New Jersey Group mean ranged from a low of $290.71 in 2018 to a high of $379.27 in 2022. The ROE Proxy Group mean ranged from a low of $251.75 in 2018 to a high of $278.15 in 2022.

The CAGR of PSE&G's total non-production gas O&M expense per customer over the 10-year period examined was negative 3.48 percent. The LDC Group's CAGR over the same period was 1.74 percent, while the Regional Group's was 1.90 percent. The New Jersey Group's CAGR was 2.49 percent, while the ROE Proxy Group's was 0.84 percent. Therefore, PSE&G's total non-production gas O&M expense per customer decreased over the years examined while the CAGR of each of the peer groups increased.

In 2022, PSE&G's total non-production O&M per gas customer of $201.47 was approximately 34 percent lower than LDC Group mean; 48 percent lower than the Regional

Group mean; 47 percent lower than the New Jersey Group mean; and 28 percent lower than the ROE Proxy Group mean.

Q. Did the comparison of PSE&G's total non-production O&M expenses per Mcf sold bases produce similar results?

A. Yes. As shown on Schedule MJA-B-15, PSE&G's total non-production O&M expenses per Mcf sold ranged from a low of $1.29 in 2021 to a high of $1.65 in 2013. The LDC Group mean ranged from a low of $1.74 in 2013 to a high of $2.05 in 2020. The Regional Group mean ranged from a low of $2.17 in 2013 to a high of $2.69 in 2020. The New Jersey Group mean ranged from a low of $2.13 in 2013 to a high of $3.17 in 2022. The ROE Proxy Group mean ranged from a low of $1.47 in 2022 to a high of $1.81 in 2020.

The CAGR of PSE&G's total non-production O&M expenses per Mcf over the 10-year period examined was negative 1.65 percent. The LDC Group's CAGR over the same period was 1.66 percent, while the Regional Group's was 2.16 percent. The New Jersey Group's CAGR was 4.53 percent, while the ROE Proxy Group's was negative 0.84 percent. Therefore, PSE&G's total non-production O&M expenses per Mcf decreased over the years examined. This decrease was greater than the ROE group decrease, while the CAGR for the LDC, Regional and New Jersey groups increased.

In 2022, PSE&G's total non-production O&M expenses per Mcf sold of $1.42 was approximately 29 percent lower than the LDC Group mean; 46 percent lower than the Regional Group mean; 55 percent lower than the New Jersey Group mean; and 3 percent lower than the ROE Proxy Group mean.

V. RELIABILITY

Q. Beyond PSE&G's financial performance, did you compare PSE&G's operational performance to that of other electric companies?

A. Yes. I reviewed PSE&G's reported System Average Interruption Duration Index ("SAIDI"), System Average Interruption Frequency Index ("SAIFI"), and Customer Average Interruption Duration Index ("CAIDI") to those of the other New Jersey electric companies as reported to the EIA via Form 861 and reported to the IEEE via IEEE's annual benchmarking survey.

Q. What does the SAIDI metric represent?

A. SAIDI is the system average duration of interruptions that a customer would experience during a period, which in the case of the New Jersey data, reflects a calendar year.

Q. How did PSE&G's SAIDI performance compare to that of the other New Jersey electric companies?

A. As shown on Schedule MJA-B-16, for the years 2013 through 2022, PSE&G's reported SAIDI was consistently below (better than) that of the other New Jersey electric companies that reported comparable metrics. PSE&G's SAIDI ranged from 33.94 in 2022 to 55.10 in 2018. Atlantic City Electric Company's ("ACE") SAIDI ranged from 51.00 in 2022 to 135.00 in 2013 and Jersey Central Power & Light Company's ("JCP&L") SAIDI ranged from 101.70 in 2015 to 192.36 in 2021. Therefore, PSE&G's electric customers, on average, experienced interruptions of service of shorter durations than did the customers of the other New Jersey utilities.

Q. What does the SAIFI metric represent?

A. SAIFI is the average number of interruptions (i.e. frequency) that a customer would experience during a period, which in the case of the New Jersey data, reflects a calendar year.

Q. How did PSE&G's SAIFI performance compare to that of the other New Jersey electric companies?

A. As shown on Schedule MJA-B-17, for the years 2013 through 2022, PSE&G's reported SAIFI was consistently below (i.e., better than) that of the other New Jersey electric companies that reported comparable metrics. PSE&G's SAIFI ranged from 0.55 in 2022 to 0.79 in 2018. ACE's SAIFI ranged from 0.65 in 2022 to 1.45 in 2013 and JCP&L's SAIFI ranged from 1.09 in 2015 to 1.69 in 2020. Therefore, PSE&G's electric customers, on average, experienced interruptions of service less frequently than did the customers of the other New Jersey utilities.

Q. What does the CAIDI metric represent?

A. CAIDI measures the average restoration time during an outage for only customers who actually experienced an interruption and is most often reported in minutes.

Q. How did PSE&G's CAIDI performance compare to that of the other New Jersey electric companies?

A. As shown on Schedule MJA-B-18, for the years 2013 through 2022, PSE&G's reported CAIDI ranged from 60.39 in 2015 to 72.13 in 2020. ACE's CAIDI ranged from 75.69 in 2017 to 102.50 in 2014 and JCP&L's CAIDI ranged from 93.30 in 2015 to 122.12 in 2022. Based upon the reported figures, not only did PSE&G's customers experience fewer interruptions; if interruptions were experienced, PSE&G's customers' power was restored more quickly than the power of other companies' customers.

Q. Does the IEEE also collect and report data for SAIDI, SAIFI, and CAIDI of electric utilities in the United States?

A. Yes. The IEEE initiated a benchmarking study in 2003 and the study is conducted annually. Participants are anonymous and are identified by key identifier only, to retain anonymity. While the participation list is not revealed, each participant can choose to share its results.

Q. Have you compared PSE&G's performance to the IEEE's 2022 study results?

A. Yes.

Q. Please describe how PSE&G's SAIFI performance for the years 2013 to 2022 compared to data reported by the IEEE.

A. As shown on Schedule MJA-B-19, PSE&G's reported SAIFI was in the first quartile of all utilities' SAIFI reported to the IEEE during each of the years 2013 to 2022, indicating that, at the very least, PSE&G was in the top 25% of all utilities surveyed. PSE&G's SAIFI ranged from 0.55 in 2022 to 0.78 in 2018.

Q. Why are PSE&G's SAIFI figures reported in the IEEE study different than those reported to the EIA, as you discussed previously?

A. It is my understanding that the EIA and IEEE have different definitions regarding major events and how they are established and as a result, the SAIFI figures are different.

Q. Does the IEEE also report CAIDI figures?

A. Yes. As shown on Schedule MJA-B-20, PSE&G's reported CAIDI was again solidly in the first quartile when compared to the companies participating in the IEEE study. PSE&G's CAIDI ranged from 60.53 in 2015 to 72.06 in 2020.

Q. Does the IEEE study also benchmark utilities' System Average Interruption Duration Index ("SAIDI")?

A. Yes, it does.

Q. What is the difference between CAIDI and SAIDI?

A. CAIDI reports duration on a customer basis, SAIDI reports duration on a system-wide basis.

Q. How did PSE&G's SAIDI compare to the IEEE study participants?

A. As shown on Schedule MJA-B-21, PSE&G's SAIDI was also in the first quartile of metrics reported in the IEEE study for all years examined. PSE&G's SAIDI ranged from 33.94 in 2022 to 53.51 in 2018.

VI. CUSTOMER SATISFACTION

Q. What customer satisfaction information did you review?

A. J.D. Power conducts and reports the results of annual customer satisfaction surveys. PSE&G is included in J.D. Power's Customer Satisfaction Studies in the "Large Utility East" segment. J.D. Power conducts customer satisfaction surveys of (1) electric residential customers; (2) electric business customers; (3) gas residential customers; and (4) gas business customers.

Q. Based upon J.D. Power's reported results for the years 2013 through 2022, where did PSE&G rank, based upon the feedback from electric residential customers?

A. As shown on Schedule MJA-B-22, PSE&G was ranked in the first quartile in every year of the analysis, except for 2013 and 2014, where it ranked in the second quartile. In the

most recent results released by J.D. Power for the calendar year 2022, electric residential customers ranked PSEG in the first quartile (and first overall) with a rating of 767.

Q. How did PSE&G rank based upon J.D. Power's survey of its electric business customers during the years 2012 through 2022?

A. As shown on Schedule MJA-B-23, PSE&G was ranked in the first or second quartile by its electric business customers during each of the years 2013 through 2022. PSE&G was ranked in the first quartile (and second overall) by its electric business customers in the most recent survey, i.e., 2022.

Q. Based upon J.D. Power's reported results for the years 2013 through 2022, where did PSE&G rank based upon the feedback from its gas residential customers?

A. As shown on Schedule MJA-B-24, PSE&G was ranked in the first or second quartile by its gas residential customers in each of the years 2013 through 2022. It should also be noted that PSE&G's gas residential customer satisfaction rating improved year-over-year for nine straight years, from 2014 to 2022. In the most recent results released by J.D. Power for the calendar year 2022, gas residential customers ranked PSEG in the first quartile (and first overall) with a rating of 770.

Q. How did PSE&G rank based upon J.D. Power's survey of its gas business customers during the years 2013 through 2022?

A. As shown on Schedule MJA-B-25, PSE&G's gas business customer satisfaction rating improved year-over-year each year from 2019 to 2021, and was ranked in the first quartile (and third overall) in 2022.

VII. SUMMARY AND CONCLUSIONS

Q. What are your conclusions based upon the analyses that you prepared?

A. PSE&G's O&M costs of the gas and electric businesses compare favorably to those of peer group averages. PSEG's ability to control costs, with some cost items having a negative CAGR over the period examined, is remarkable. Similarly, PSE&G's reliability and customer satisfaction scores indicate strong performance and a focus on improvement.

Given PSE&G's strong performance, as set forth in my testimony, I am recommending that the results of the benchmarking analyses be considered by Company witness Ann Bulkley when establishing her recommended range of return on equity values for PSE&G's electric and gas businesses. In my opinion, it is appropriate for the BPU to set PSE&G's ROE at the upper end of Ms. Bulkley's range of return on equity in recognition of the Company's consistently strong cost control, operational performance, service quality and customer satisfaction performance. Therefore, I recommend that PSE&G's authorized return on equity be established at a level that reflects PSE&G's strong performance and cost management in an operating environment where costs tend to be higher.

Q. Does this conclude your direct testimony?

A. Yes, it does.

MICHAEL J. ADAMS
SENIOR VICE PRESIDENT

Mr. Adams has over thirty-five years of direct experience in the public utility industry. He has worked for an investor-owned utility, a regulatory agency, and most recently as a consultant to the utility industry.

While employed by Illinois Power Company, Mr. Adams monitored project expenditures associated with gas and electric distribution, transmission, and generation capital projects.

While employed by the Illinois Commerce Commission, Mr. Adams initially evaluated the rate filings of regulated utilities and provided expert testimony regarding the reasonableness of the requests. Mr. Adams was subsequently charged with developing and managing a management and operations audit program to evaluate company management policies, procedures, and performance, as well as operational efficiency and effectiveness. Mr. Adams served as the Deputy Executive Director of the agency at the time of his departure. As a consultant, Mr. Adams has provided consulting services to regulatory agencies and regulated utilities on an array of operational and financial issues since 1995.

Prior to joining Concentric, Mr. Adams was a Managing Director of Navigant Consulting, Inc. Mr. Adams is a Certified Public Accountant, a graduate of Illinois College and holds an M.B.A. from the University of Illinois, Springfield.

Mr. Adams provides financial, regulatory, strategic, operational and litigation support to his energy clients. He has assisted clients with regulatory/legislative initiatives related to the approval and implementation of alternative regulation plans as well as the preparation and support of regulatory filings under alternative rate plans. Mr. Adams also provides advisory services in the areas of mergers and acquisitions. As a consultant, Mr. Adams has provided expert testimony or reports before State and Federal regulatory agencies.

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
JOHN J. SPANOS
PRESIDENT, GANNETT FLEMING VALUATION
AND RATE CONSULANTS, LLC

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is John J. Spanos. My business address is 207 Senate Avenue, Camp Hill, Pennsylvania, 17011.

Q. By whom and in what capacity are you employed?

A. I am employed by Gannett Fleming Valuation and Rate Consultants, LLC (Gannett Fleming) as President.

Q. Please describe your educational background and qualifications.

A. I have Bachelor of Science degrees in Industrial Management and Mathematics from Carnegie-Mellon University and a Master of Business Administration from York College. I have over 37 years of depreciation experience, which includes giving expert testimony in more than 440 cases before 46 regulatory commissions, including this Commission. These cases have included depreciation studies in the electric, gas, water, wastewater and pipeline industries. In addition to cases where I have submitted testimony, I have also supervised over 800 other depreciation or valuation assignments. Please refer to Schedule JJS-2 for my qualifications statement, which includes further information with respect to my work history, case experience, and leadership in the Society of Depreciation Professionals.

Q. Have you submitted testimony to any utility commissions on the subject of utility plant depreciation?

A. Yes. I have submitted testimony to many regulatory commissions, the Federal Energy Regulatory Commission (FERC) and Canadian regulatory bodies. Schedule JJS-2 includes a list of cases in which I have submitted testimony.

Q. What is the purpose of your prefiled direct testimony in this proceeding?

A. I was asked to recommend depreciation rates for Public Service Electric and Gas Company's (PSEG or the Company) Electric Distribution and General Plant Accounts and all Gas and Common Plant Accounts. I am sponsoring Schedules JJS-1 stating the results of my depreciation analysis related to Public Service Electric and Gas Company's electric, gas and common plant as of December 31, 2022 (the Depreciation Study or Study). The recommended depreciation rates for PSEG are set forth on pages VI-4 through VI-7 of Schedule JJS-1.

Q. Would you please summarize your testimony?

A. My testimony will explain the methods and procedures of the Depreciation Study and sets forth the annual depreciation rates as of December 31, 2022 for electric, gas and common plant. Schedule JJS-1 sets forth detailed methods, procedures and results of the Depreciation Study as of December 31, 2022. My Depreciation Study will be explained in Part II of my testimony.

Q. Please summarize the principal conclusion of your depreciation study.

A. The principal conclusion of the Electric and Gas Studies is that PSEG's current depreciation rates must be updated as the parameters upon which those rates are based are no longer appropriate. I have proposed updated depreciation accrual rates by plant account in the Depreciation Study. Generally, my recommended rates are based on a combination of my review

of historic data and PSEG's operating maintenance practices, as well as the application of informed engineering judgment. Schedule JJS-3 sets forth a comparison of the proposed rates vs. current rates as of December 31, 2022.

II. METHODS USED IN DEPRECIATION STUDY

Q. Please define the concept of depreciation.

A. Depreciation refers to the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation, against which the Company is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand and the requirements of public authorities.

Q. In preparing the depreciation study, did you follow generally accepted practices in the field of depreciation and valuation?

A. Yes.

Q. Please describe the contents of your report.

A. The Depreciation Study, Schedule JJS-1 is presented in nine parts. Part I, Introduction, presents the scope and basis for the Depreciation Study. Part II, Estimation of Survivor Curves, includes descriptions of the methodology of estimating survivor curve. Parts III and IV set forth the analysis for determining life and net salvage estimates. Part V, Calculation of Annual and Accrued Depreciation, includes the concepts of depreciation and amortization using the remaining life. Part VI, Results of Study, presents a description of the results of my analysis and a summary of the depreciation calculations. Parts VII, VIII and IX include graphs and tables that relate to the service life and net salvage analyses and the detailed depreciation calculations by account.

Schedule JJS-1, Tables 1 and 2 on pages VI-4 through VI-7 present the estimated survivor curve, net salvage percentage, the original cost as of December 31, 2022, the calculated annual depreciation accrual amount and rate, book depreciation reserve, future accruals and the composite remaining life for each account or subaccount. The section beginning on page VII-2 presents the results of the retirement rate analyses prepared as the historical bases for the service life estimates. The section beginning on page VIII-2 presents the results of the analyses of historical net salvage data. The section beginning on page IX-2 presents the depreciation calculations related to surviving original cost as of December 31, 2022. The appendix sets forth the depreciation results using the net normalization method for net salvage.

Q. Please identify the depreciation method that you used.

A. I used the straight line remaining life method of depreciation, with the average service life procedure. This is the method which PSEG used in its most recent rate proceedings. This method of depreciation aims to distribute the unrecovered cost of fixed capital assets over the estimated remaining useful life of each unit or group of assets in a systematic and rational manner.

Electric General Plant Accounts 391.1, 391.2, 391.31, 392.1, 392.2, 393, 394, 395, 396, 397, and 398, and for Gas General Plant Accounts 391.1, 391.2, 391.3, 391.33, 392.1, 392.2, 393, 394, 395, 396, 397 and 398, I used the straight line remaining life method of amortization, which is consistent with current practices. The account numbers identified throughout my testimony represent those in effect as of December 31, 2022. The annual amortization is based on amortization accounting that distributes the unrecovered cost of fixed capital assets over the remaining amortization period selected for each account and vintage.

Amortization accounting for certain accounts is recommended because of the disproportionate plant accounting effort required when compared to the minimal original cost of the large number of items in these accounts. An explanation of the calculation of annual and accrued amortization is presented on pages V-4 and V-5 of the Depreciation Study.

Q. What are your recommended annual depreciation accrual rates for PSEG?

A. My recommended annual depreciation accrual rates as of December 31, 2022 for PSEG are set forth on pages VI-4 through VI-7 of Schedule JJS-1.

Q. How did you determine the recommended annual depreciation accrual rates?

A. I did this in two phases. In the first phase, I estimated the service life and net salvage characteristics for each depreciable group (*i.e.,* each plant account or subaccount identified as having similar characteristics). In the second phase, I calculated the composite remaining lives and annual depreciation accrual rates based on the service life and net salvage estimates determined in the first phase.

Q. Please describe the first phase of the Depreciation Study, in which you estimated the service life characteristics for each depreciable group.

A. The service life study consisted of compiling historic data from records related to PSEG's plant; analyzing these data to obtain historic trends of survivor characteristics; obtaining supplementary information from management and operating personnel concerning practices and plans as they relate to plant operations; and interpreting the above data and the estimates used by other electric and gas utilities to form judgments of average service life characteristics**.**

Q. What historic data did you analyze for the purpose of estimating service life characteristics?

A. I analyzed the Company's accounting entries that record plant transactions during the 48-year period 1975 through 2022 for all electric and gas assets. The transactions included additions, retirements, transfers and the related balances. The Company records also included surviving dollar value by year installed for each plant account as of December 31, 2022.

Q. What method did you use to analyze this service life data?

A. I used the retirement rate method for all accounts. This is the most appropriate method when aged retirement data are available, because it determines the average rates of retirement actually experienced by the Company during the period covered by the study.

Q. Would you explain how you used the retirement rate method to analyze PSEG's service life data?

A. I applied the retirement rate method to each different group of property in the study. For each property group, I used the retirement rate method to form a life table which, when plotted, shows an original survivor curve for that property group. Each original survivor curve represents the average survivor pattern experienced by the several vintage groups during the experience band studied. The survivor patterns do not necessarily describe the life characteristics of the property group; therefore, interpretation of the original survivor curves is required in order to use them as valid considerations in estimating service life. The Iowa-type survivor curves were used to perform these interpretations.

Q. What is an "Iowa-type survivor curve" and how did you use such curves to estimate the service life characteristics for each property group?

A. Iowa-type curves are a widely used group of generalized survivor curves that contain the range of survivor characteristics usually experienced by utilities and other industrial companies.

The Iowa curves were developed at the Iowa State University College of Engineering Experiment Station through an extensive process of observing and classifying the ages at which various types of property used by utilities and other industrial companies had been retired.

Iowa-type curves are used to smooth and extrapolate original survivor curves determined by the retirement rate method. The Iowa curves and truncated Iowa curves were used in this study to describe the forecasted rates of retirement based on the observed rates of retirement and the outlook for future retirements. As I will explain, the use of truncated curves is appropriate to reflect retirements of plant components that may not be fully depreciated at the time a plant is retired.

The estimated survivor curve designations for each depreciable property group indicate the average service life, the family within the Iowa system to which the property group belongs, and the relative height of the mode. For example, the Iowa 60-R1 indicates an average service life of sixty years; a right-moded, or R, type curve (the mode occurs after average life for right-moded curves); and a low height, 1, for the mode (possible modes for R type curves range from 0.5 to 5).

Q. What approach did you use to estimate the lives of significant structures such as office buildings?

A. I used the life span technique to estimate the lives of significant structures for which concurrent retirement of the entire facility is anticipated. In this technique, the survivor characteristics of such facilities are described by the use of interim survivor curves and estimated probable retirement dates.

The interim survivor curves describe the rate of retirement related to the replacement of elements of the facility, such as, for a building, the retirements of plumbing, heating, doors, windows and roofs, which occur during the life of the facility. The probable retirement date

provides the rate of final retirement for each year of installation for the facility by truncating the interim survivor curve for each installation year at its attained age at the date of probable retirement. The use of interim survivor curves truncated at the date of probable retirement provides a consistent method for estimating the lives of the several years of installation for a particular facility inasmuch as a single concurrent retirement for all years of installation will occur when it is retired.

Q. Has Gannett Fleming used this approach in other proceedings?

A. Yes. We have used the life span technique in performing depreciation studies presented to and accepted by many public utility commissions across the United States and Canada. This is consistent with the development of current rates.

Q. What are the bases for the probable retirement years that you have estimated for the Office Building?

A. The probable retirement year for the Office Building is based on my professional judgment and incorporates consideration of the age, use, size, nature of construction, management outlook and typical life spans experienced and used by other utilities for similar facilities. The life span results in a probable retirement year that is many years in the future. As a result, the retirement of this facility is not yet subject to specific management plans. Such plans would be premature. At the appropriate time, detailed studies of the economics of rehabilitation and continued use or retirement of the structure will be performed and the results incorporated in the estimation of the facility's life span.

Q. Have you physically observed PSEG's assets as part of your depreciation study?

A. Yes. I made field reviews of PSEG's property in September 2023 to update my analyses on a representative portion of plant. I have conducted field visits as part of prior studies in

October and November 2016. Field reviews are conducted to become familiar with Company operations and obtain an understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements. For example, I had detailed discussions with Company personnel regarding the different forces of retirement for some of their regions. This knowledge as well as information from other discussions with management was incorporated into my statistical analyses.

Q. How did your experience in development of other depreciation studies affect your work in this case?

A. Because I customarily conduct field reviews for my depreciation studies, I have had the opportunity to visit scores of similar plants and meet with operations personnel at other companies. The knowledge accumulated from those visits and meetings provide me useful information that I can draw on to confirm or challenge my numerical analyses concerning plant condition and remaining life estimates.

Q. Would you please explain the concept of "net salvage"?

A. Net salvage is a component of the service value of capital assets that is recovered through depreciation rates. The service value of an asset is its original cost less its net salvage. Net salvage is the salvage value received for the asset upon retirement less the cost to retire the asset. When the cost to retire exceeds the salvage value, the result is negative net salvage.

Inasmuch as depreciation expense is the loss in service value of an asset during a defined period, *e.g.,* one year, it must include a ratable portion of both the original cost and the net salvage. That is, the net salvage related to an asset should be incorporated in the cost of service during the same period as its original cost so that customers receiving service from the asset pay rates that include a portion of both elements of the asset's service value, the original cost and the net salvage value.

For example, the full recovery of the service value of $5,000 distribution overhead conductors will include not only the $5,000 of original cost, but also, on average, $1,300 to remove at the end of its life and $50 in salvage value. In this example, the net salvage component is negative $1,250 ($50 - $1,300), and the net salvage percent is negative 25% (($50 - $1,300)/$5,000).

Q. Have you included a net salvage percentage as part of the depreciation accrual rate?

A. Yes, in order to be consistent with the most common practice for determining accrual accounting. However, the recent practices by the New Jersey Board of Public Utilities, the net salvage percentage accrual has been replaced by a net salvage normalization amount. The net salvage normalization method is a backward looking average of experienced net salvage costs. I do not believe it is an appropriate and reasonable method for recovery of the net salvage costs. As discussed in greater detail below, the normalization approach pushes the cost of removal away from customers who benefit from the assets providing service and onto future customers. This is an example of intergenerational inequity. The net normalization method is set forth in the Appendix of the Depreciation Study.

Q. Please describe how recent practice in New Jersey has estimated net salvage normalization amounts.

A. The estimate of the net salvage normalization amounts for each account has been based on historical data for the most recent 5-year period which in this case would be 2018-2022. In the historical analyses cost of removal and gross salvage amounts were recorded by account within the 5-year period, 2018-2022. Years prior to 2018 were reviewed to understand the trend of cost of removal and gross salvage which show cost of removal has been increasing at a high rate. Then in this practice the five-year average of these experienced costs is calculated and incorporated as the annual cost of removal expense reflected in the depreciation rate.

Q. Please describe the process that you used in the Depreciation Study to calculate composite remaining lives and annual depreciation accrual rates.

A. After I estimated the service life characteristics for each depreciable property group, I calculated the annual depreciation accrual rates for each group based on the straight line remaining life method, using remaining lives weighted consistent with the average service life procedure. The annual depreciation accrual rates were developed as of December 31, 2022.

Q. Please describe the straight line remaining life method of depreciation.

A. The straight line remaining life method of depreciation allocates the original cost of the property, less accumulated depreciation, less future net salvage, in equal amounts to each year of remaining service life.

Q. Please describe the average service life procedure for calculating remaining life accrual rates.

A. The average service life procedure defines the group for which the remaining life annual accrual is determined. Under this procedure, the annual accrual rate is determined for the entire group or account based on its average remaining life and this rate is applied to the surviving balance of the group's cost. The average remaining life of the group is calculated by first dividing the future book accruals (original cost less allocated book reserve less future net salvage) by the average remaining life for each vintage. The average remaining life for each vintage is derived from the area under the survivor curve between the attained age of the vintage and the maximum age. Then, the sum of the future book accruals is divided by the sum of the annual accruals to determine the average remaining life of the entire group for use in calculating the annual depreciation accrual rate.

Q. You stated earlier that for general plant accounts you continued the use of amortization accounting to calculate proposed deprecation rates. Could you please describe amortization accounting?

A. Yes. In amortization accounting, units of property are capitalized in the same manner as they are in depreciation accounting. However, amortization accounting is more appropriate than depreciation accounting for accounts with a large number of units, but small asset values. This is true because in order to properly reflect plant in service, depreciation accounting requires periodic inventories, which is a difficult and burdensome task for these assets (*i.e.*, large number of units, but small values). Consequently, a more accurate method is to record retirements when a vintage is fully amortized rather than as the units are removed from service. As a result, there is no dispersion of retirement. All units are retired when the age of the vintage reaches the amortization period. Each plant account or group of assets is assigned a fixed period which represents an anticipated life which the asset will render full benefit. For example, in amortization accounting, assets that have a 7-year amortization period will be fully recovered after 7 years of service and taken off the Company's books, but not necessarily removed from service. In contrast, assets that are taken out of service before 7 years remain on the books until the amortization period for that vintage has expired.

Q. Can you explain why you recommend amortization accounting?

A. Amortization accounting has been implemented by almost all utility companies across the United States and Canada over the past 25-30 years. I have presented this methodology in the depreciation study in order to smooth the annual depreciation accrual rate over time for the specific asset classes described in general plant as well as to improve record keeping practices for a large number of assets that have a small utility plant in service value.

Q. For which plant accounts is amortization accounting being implemented?

A. Amortization accounting is only appropriate for certain General Plant accounts. These are accounts 390.1, 391.1, 391.2, 391.31, 392.1, 392.2, 393, 394, 395, 396, 397, and 398 for electric plant and 391.1, 391.2, 391.3, 391.33, 392.1, 392.2, 393, 394, 395, 396, 397 and 398 for gas plant. They represent slightly less than three percent of electric depreciable plant and slightly more than one percent of gas depreciable plant.

Q. Please use an example to illustrate the development of the annual depreciation accrual rate for a particular group of property in your depreciation study.

A. I will use Electric Account 367, Underground Transformers, as an example because it is one of the largest depreciable groups and represents approximately 14% of depreciable plant for PSEG's electric distribution plant.

I used the retirement rate method to analyze the survivor characteristics of this property group. I compiled aged plant accounting data from 1976 through 2022 and analyzed the data for periods that best represent the overall service life of the property. I present the life tables for the 1976-2022 and 1990-2022 experience bands on pages VII-36 through VII-41 of Schedule JJS-1. The life table displays the retirement and surviving ratios of the aged plant data exposed to retirement by age interval. For example, page VII-36 shows $1,693,667 retired during age interval 0.5-1.5 with $1,497,824,649 exposed to retirement at the beginning of the interval. Consequently, the retirement ratio is 0.0011 ($1,693.667/$1,497,824,649) and the surviving ratio is 0.9989 (1-.0011). The percent surviving at age 0.5 of .9989 percent is multiplied by the survivor ratio of 99.92 to derive the percent surviving at age 1.5 of 99.80 percent. This process continues for the remaining age intervals for which plant was exposed to retirement during the period 1976-2022. The resultant life table, or original survivor curve, is plotted along with the estimated smooth survivor curve, the 58-R2 on page VII-35.

The net salvage percent is presented on pages VIII-18 through VIII-20. The percentage is based on the result of annual gross salvage minus the cost to remove plant assets as compared to the original cost of plant retired during the period 1977 through 2022. The 46-year period experienced negative $70,137,501 ($38,628,699-$108,766,199) in net salvage for $157,148,249 plant retired. The result is negative net salvage of 45% ($70,137,501/$157,148,249). Based on the statistics for this account as well as the three-year rolling averages, most recent five-year average and the estimates of others in the industry, the recommended net salvage for underground conductor is negative 20%.

I provide my calculation of the annual depreciation related to original cost of Account 367, Underground Conductors and Devices, as of December 31, 2022, on pages IX-19 through IX-21 Schedule JJS-1. The calculation is based on the 58-R2 survivor curve, negative 20 percent net salvage, the attained age, and the allocated book reserve. The tabulation sets forth the installation year, the original cost, calculated accrued depreciation, allocated book reserve, future accruals, remaining life and annual accrual. These totals are brought forward to Table 1 on page VI-4.

Q. Please explain the method for the recovery of net salvage used in the Appendix of Schedule JJS-1.

A. The Appendix sets forth accruing for net salvage based on the net salvage costs over the most recent five years. Basically, an expense approach where the level of net salvage over the last five years will be the component of net salvage to be added to the life depreciation rate.

Q. What has been the practices in New Jersey in recent years?

A. In recent years, the practice in New Jersey sets the depreciation accruals for net salvage similar to, if not the same as, the average of the most recent 5-year expenditures on net salvage. If this is taken to its logical extension, the annual net salvage accruals in a given year should be

the same as (or at least approximate) the costs incurred during that year. As a result, the current practices, in effect, recover net salvage as an operating expense instead of recovering the service value of assets over the assets' service lives. This occurs because this approach does not provide for recovery of the full net salvage that will be incurred for plant currently in service. The result is lower revenue requirements today, but with the deferral of recovery to future customers with a net result of recovery of less than the full amount of removal costs.

Q. Can you explain the differences between the traditional method and the New Jersey approach?

A. Yes. When using the traditional method, net salvage is estimated as a percentage of the original cost of plant. The statistical analysis used in estimating net salvage is based on comparing historical, not only recent, net salvage expenditures to historical retirements. This methodology, which to my knowledge is supported by all authoritative depreciation texts, provides a reasonable basis for net salvage estimation because the amount of net salvage expended in a given year is a function of the number of assets retired in that year. That is, if the Company were to retire 1,000 poles in one year, it should be expected to have a higher total net salvage cost than if it were to only retire 100 poles. Therefore, it is reasonable to expect net salvage to increase in proportion to the amount of retirements that occur. The traditional method recognizes this relationship. This relationship is important because most companies should be expected to have more retirements in the future than they have had historically.

Q. Does the current New Jersey method recognize this important relationship?

A. No, it does not. This method fails to recognize that net salvage is a function of the number of assets retired in a given year. By focusing on only the recent net salvage expenditures, the current New Jersey practice is effectively assuming that the Company will experience the same net salvage costs independent of whether it retires 100 poles or 1,000 poles. This method also

fails to recognize that in order to accrue for the net salvage costs for assets currently in service, future net salvage costs must be recognized in depreciation expense. Future net salvage costs (i.e., primarily removal costs) are likely higher than current removal costs, in large part because future retirements will be higher than current retirements. The New Jersey method does not recognize these concepts, and instead is designed to only recover the costs recently spent on assets that have already been retired.

Q. Can you provide a simple example that demonstrates the New Jersey method fails to appropriately allocate net salvage costs over the service lives of property?

A. Yes. Consider the following hypothetical scenario, which I will analyze over a 40-year period:

- A company installs a single asset at a cost of $1,000 in the beginning of year 1.
- The asset has a life of 10 years, and at the end of the asset's life it will be replaced by an identical asset with the same service life and same cost.
- Upon replacement, the cost to remove the retired asset will be $200.
- A depreciation study is conducted periodically; (assume every five years) and new depreciation rates are calculated at the time of each study.

Using these parameters, we can analyze the difference between the traditional method and the New Jersey method.

Q. What is the depreciation rate that would be calculated using the traditional method?

A. Under the traditional method, the net salvage estimate is negative 20% ($200 / $1,000) and the service life estimate is 10 years. The depreciation rate is therefore (1 – (-20%))/10 = 12%. Using the traditional method, the depreciation rate will be the same 12% in each year.

Q. How does this compare to the New Jersey method?

A. Again, the New Jersey method is based on the concept that the annual accruals for net salvage should be the same as recent net salvage expenditures. For the purposes of this example, when using this approach the net salvage estimate is calculated to produce net salvage accruals that equal the most recent five-year average of net salvage expenditures. This will produce a different depreciation rate depending on the recent experience. In the first depreciation study in year 1, the net salvage estimate will be 0%, since the most recent five-year average of net salvage is zero. The same estimate will be made in the second depreciation study in year six. However, in the depreciation study performed in year 11 - after the retirement of the initial asset - the net salvage jumps significantly to negative 40%, resulting in a depreciation rate of 14%. It then falls back to 0% in year 16 before returning to negative 40 percent in year 21. Thus, the depreciation rate fluctuates from 10% to 14% over the lives of the assets. A comparison of the annual depreciation rates and accruals based on the traditional method and the New Jersey method is shown in Table 1 below.

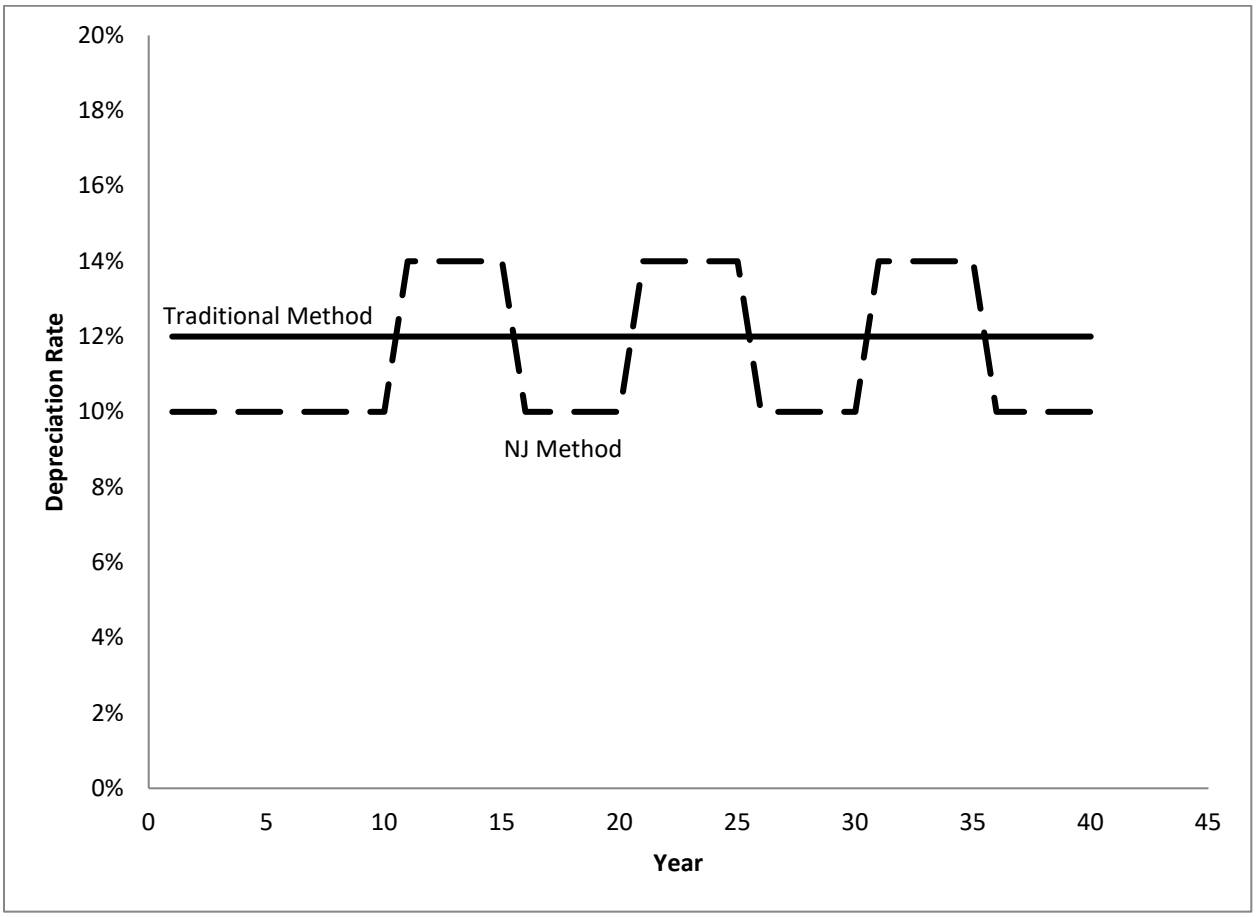
Table 1: Comparison of Annual Depreciation Accruals and Rates

	Traditional Method		NJ Method	
Year	Accrual	Rate	Accrual	Rate
1-5	120	12%	100	10%
6-10	120	12%	100	10%
11-15	120	12%	140	14%
16-20	120	12%	100	10%
21-25	120	12%	140	14%
26-30	120	12%	100	10%
31-35	120	12%	140	14%
36-40	120	12%	100	10%

A comparison of the two methods over time is also shown graphically in Figure 1 below. The figure shows the depreciation rates over the full 40-year period based on each method. The

solid line in the figure presents the depreciation rate in each year using the traditional method. The dashed line represents the depreciation rate in each year using the New Jersey method.

Figure 1: Comparison of Traditional and NJ Methods



As can be seen in both Table 1 and Figure 1, the traditional method results in a consistent recovery pattern over the lives of the assets, and costs are allocated in a systematic and rational manner. By contrast, the depreciation rates using the New Jersey method vary considerably from year to year and from study to study.

Q. Is there a requirement that costs be depreciated in a systematic and rational manner?

A. Yes. The Uniform System of Accounts requires that costs be depreciated in a systematic and rational manner.

Q. What causes the volatility in depreciation rates that occurs when using the New Jersey method, as demonstrated in Figure 1?

A. The volatility is the result of the fact that the New Jersey method is not a forward looking method that estimates the net salvage that will occur in the future for the assets currently in service. Instead, it is backward looking, and only recovers the level of net salvage that has occurred in the recent past. The method therefore has the potential to create wide swings in depreciation rates.

Q. Have you conducted a net salvage accrual analysis to measure how much of an impact in cost of removal recovery results from use of the traditional method as opposed to the net salvage normalization method based on future expected removal costs?

A. Yes. Schedule JJS-3 sets forth the annual depreciation accrual rates by account for electric and gas plant if the industry standard method for calculating the net salvage accrual component embedded in the rates was utilized. The table shows that using the traditional method, the annual total depreciation expense for electric and gas would be $597.5 million (Column 6) versus $516.3 million. The $597.5 million annual expense utilizes net salvage estimates for many accounts which are based on industry ranges, as well as Company statistics. Utilizing the net normalization method is a $81.2 million deficiency in annual depreciation expense that will need to be recovered from future customers in future rate cases.

Q. Does this conclude your testimony?

A. Yes, it does.

Attention Scott Jennings
Senior Vice President, Finance, Planning and Strategy

Ladies & Gentlemen:

Pursuant to your request, we have conducted a depreciation study related to the electric distribution, gas and common plant of Public Service Electric and Gas Company as of December 31, 2022. The attached report presents a description of the methods used in the estimation of depreciation, the summary of annual and accrued depreciation, the statistical support for the service life and net salvage estimates, and the detailed tabulations of annual and accrued depreciation.

Respectfully submitted,

GANNETT FLEMING VALUATION
AND RATE CONSULTANTS, LLC

PUBLIC SERVICE ELECTRIC AND GAS COMPANY

DEPRECIATION STUDY

EXECUTIVE SUMMARY

Pursuant to Public Service Electric and Gas Company's ("PSEG" or "Company") request, Gannett Fleming Valuation and Rate Consultants, LLC ("Gannett Fleming") conducted a depreciation study related to the electric distribution, gas and common plant as of December 31, 2022. The purpose of this study was to determine the annual depreciation accrual rates and amounts for book and ratemaking purposes.

The depreciation rates are based on the straight line method using the average service life ("ASL") procedure and were applied on a remaining life basis. The calculations were based on attained ages and estimated average service life and forecasted net salvage characteristics for each depreciable group of assets.

Gannett Fleming recommends the calculated annual depreciation accrual rates set forth herein apply specifically to electric distribution, gas and common plant in service as of December 31, 2022 as summarized in Column 9 of Table 1 and Column 8 of Table 2 of the Study.

The study results set forth an annual depreciation expense of $597.6 million when applied to depreciable plant balances as of December 31, 2022. The results are summarized at the functional level as follows:

SUMMARY OF ORIGINAL COST, ACCRUAL RATES AND AMOUNTS

FUNCTION	ORIGINAL COST	PROPOSED RATE	PROPOSED EXPENSE
Electric Plant			
Distribution Plant	$10,638,819,527.08	2.71	$287,908,662
General Plant	34,060,708.63	1.80	612,821
General Plant-Amortized	323,859,151.30	9.00	29,154,679
Common Plant	71,440,287.98	2.55	1,824,328
Total Electric and Common Plant	**$11,068,179,674.99**	**2.89**	**$319,500,490**
Gas Plant			
Production Plant	$ 50,884,995.97	0.00	$ 1,448
Other Storage Plant	19,551,736.69	1.16	226,449
Transmission Plant	98,123,267.16	1.82	1,788,861
Distribution Plant	10,350,466,845.66	2.49	257,571,663
General Plant	23,262,931.72	1.82	424,132
General Plant-Amortized	176,368,559.37	10.23	18,037,685
Total Gas Plant	**$10,718,658,336.57**	**2.59**	**$278,050,238**
Total Depreciable Electric, Common and Gas Plant	**$21,786,838,011.56**		**$597,550,728**

PART I. INTRODUCTION

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DEPRECIATION STUDY

PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for Public Service Electric and Gas Company ("PSEG" or "Company"), as applied to specific electric, gas and common plant in service as of December 31, 2022. The rates and amounts are based on the straight line remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to current electric, gas and common plant in service.

The service life and net salvage estimates resulting from the study were based on informed judgment which incorporated analyses of historical plant retirement data as recorded through 2022; the net salvage analyses of historical plant retirement data recorded through 2022; a review of Company practice and outlook as they relate to plant operation and retirement; and consideration of current practice in the electric and gas industry, including knowledge of service lives and net salvage estimates used for other electric and gas companies.

PLAN OF REPORT

Part I, Introduction, contains statements with respect to the plan of the report, and the basis of the study. Part II, Estimation of Survivor Curves, presents descriptions of the considerations and the methods used in the service life study. Part III, Service Life Considerations, presents the factors and judgment utilized in the average service life analysis. Part IV, Net Salvage Considerations, presents the judgment utilized for the net salvage study. Part V, Calculation of Annual and Accrued Depreciation, describes the

salvage study. Part V, Calculation of Annual and Accrued Depreciation, describes the procedures used in the calculation of group depreciation. Part VI, Results of Study, presents a summary by depreciable group of annual depreciation accrual rates and amounts, as well as composite remaining lives. Part VII, Service Life Statistics presents the statistical analysis of service life estimates, Part VIII, Net Salvage Statistics sets forth the statistical indications of net salvage percents, and Part IX, Detailed Depreciation Calculations presents the detailed tabulations of annual depreciation.

BASIS OF THE STUDY

Depreciation

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing electric or gas utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight line method of depreciation.

For most accounts, the annual depreciation was calculated by the straight line method using the average service life procedure and the remaining life basis. For certain General Plant accounts, the annual depreciation is based on amortization accounting. Both types of calculations were based on original cost, attained ages, and estimates of service lives.

The straight line method, average service life procedure is a commonly used depreciation calculation procedure that has been widely accepted in jurisdictions throughout North America. Gannett Fleming recommends its continued use. Amortization accounting is used for certain General Plant accounts because of the disproportionate plant accounting effort required when compared to the minimal original cost of the large number of items in these accounts. An explanation of the calculation of annual and accrued amortization is presented beginning on page V-4 of the report.

Service Life and Net Salvage Estimates

The service life and net salvage estimates used in the depreciation calculations were based on informed judgment which incorporated a review of management's plans, policies and outlook, a general knowledge of the electric and gas utility industry, and comparisons of the service life and net salvage estimates from our studies of other electric and gas utilities. The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for utility property. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts.

The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data analyses and the

probable future. The combination of the historical experience and the estimated future yielded estimated survivor curves from which the average service lives were derived.

The estimates of net salvage by account incorporated a review of experienced costs of removal and net salvage related to plant retirements, and consideration of trends exhibited by the historical data. Each component of net salvage, i.e., cost of removal and gross salvage, was stated in dollars and as a percent of retirement.

An understanding of the function of the plant and information with respect to the reasons for past retirements and the expected causes of future retirements was obtained through discussions with operating and management personnel. The supplemental information obtained in this manner was considered in the interpretation and extrapolation of the statistical analyses.

PART II. ESTIMATION OF SURVIVOR CURVES

PART II. ESTIMATION OF SURVIVOR CURVES

The calculation of annual depreciation based on the straight line method requires the estimation of survivor curves and the selection of group depreciation procedures. The estimation of survivor curves is discussed below and the development of net salvage is discussed in later sections of this report.

SURVIVOR CURVES

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units or by constructing a survivor curve by plotting the number of units which survive at successive ages.

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

This study has incorporated the use of Iowa curves developed from a retirement rate analysis of historical retirement history. A discussion of the concepts of survivor curves and of the development of survivor curves using the retirement rate method is presented below.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements (or the portion of the frequency curve with the highest level of retirements) in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family. A higher number designates a higher mode curve.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.

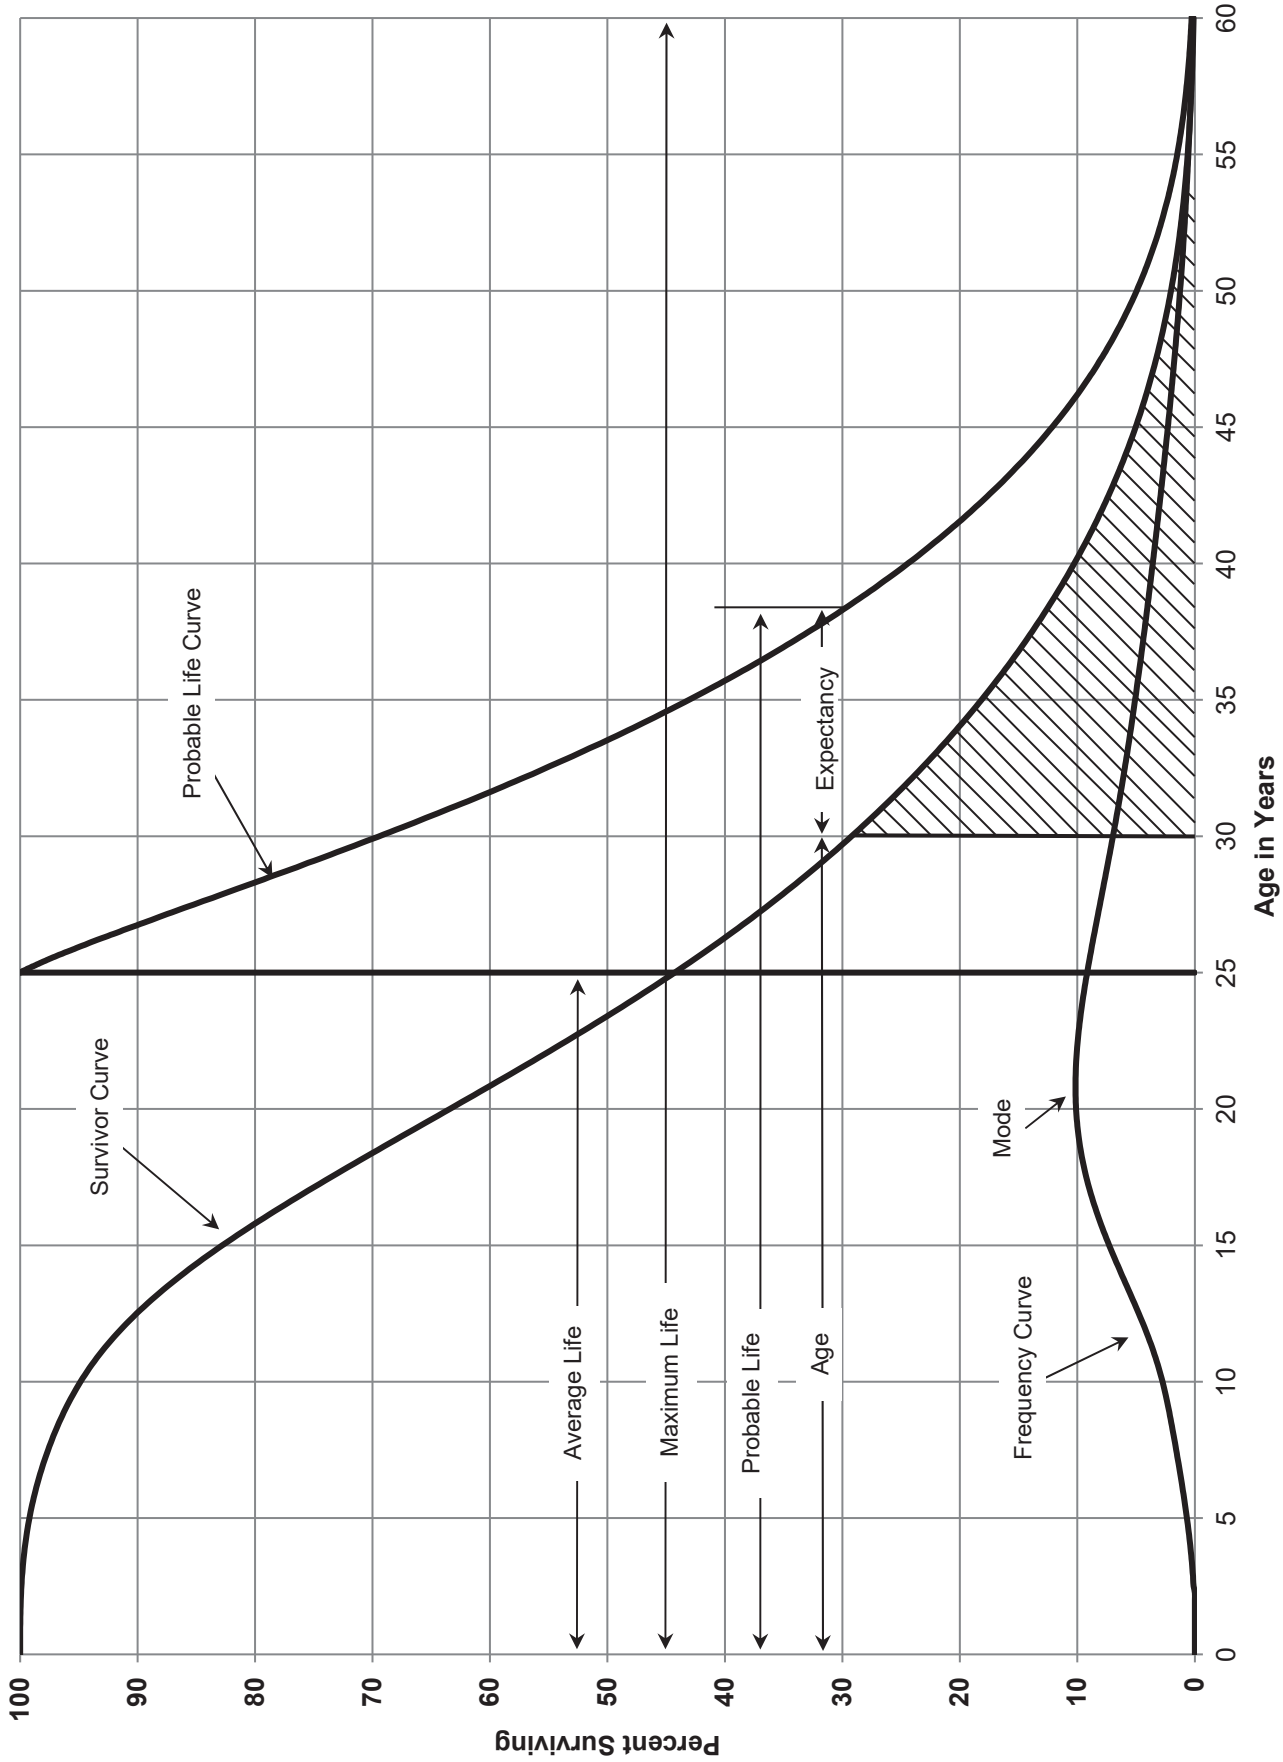

FIGURE 1. TYPICAL SURVIVOR CURVE AND DERIVED CURVES

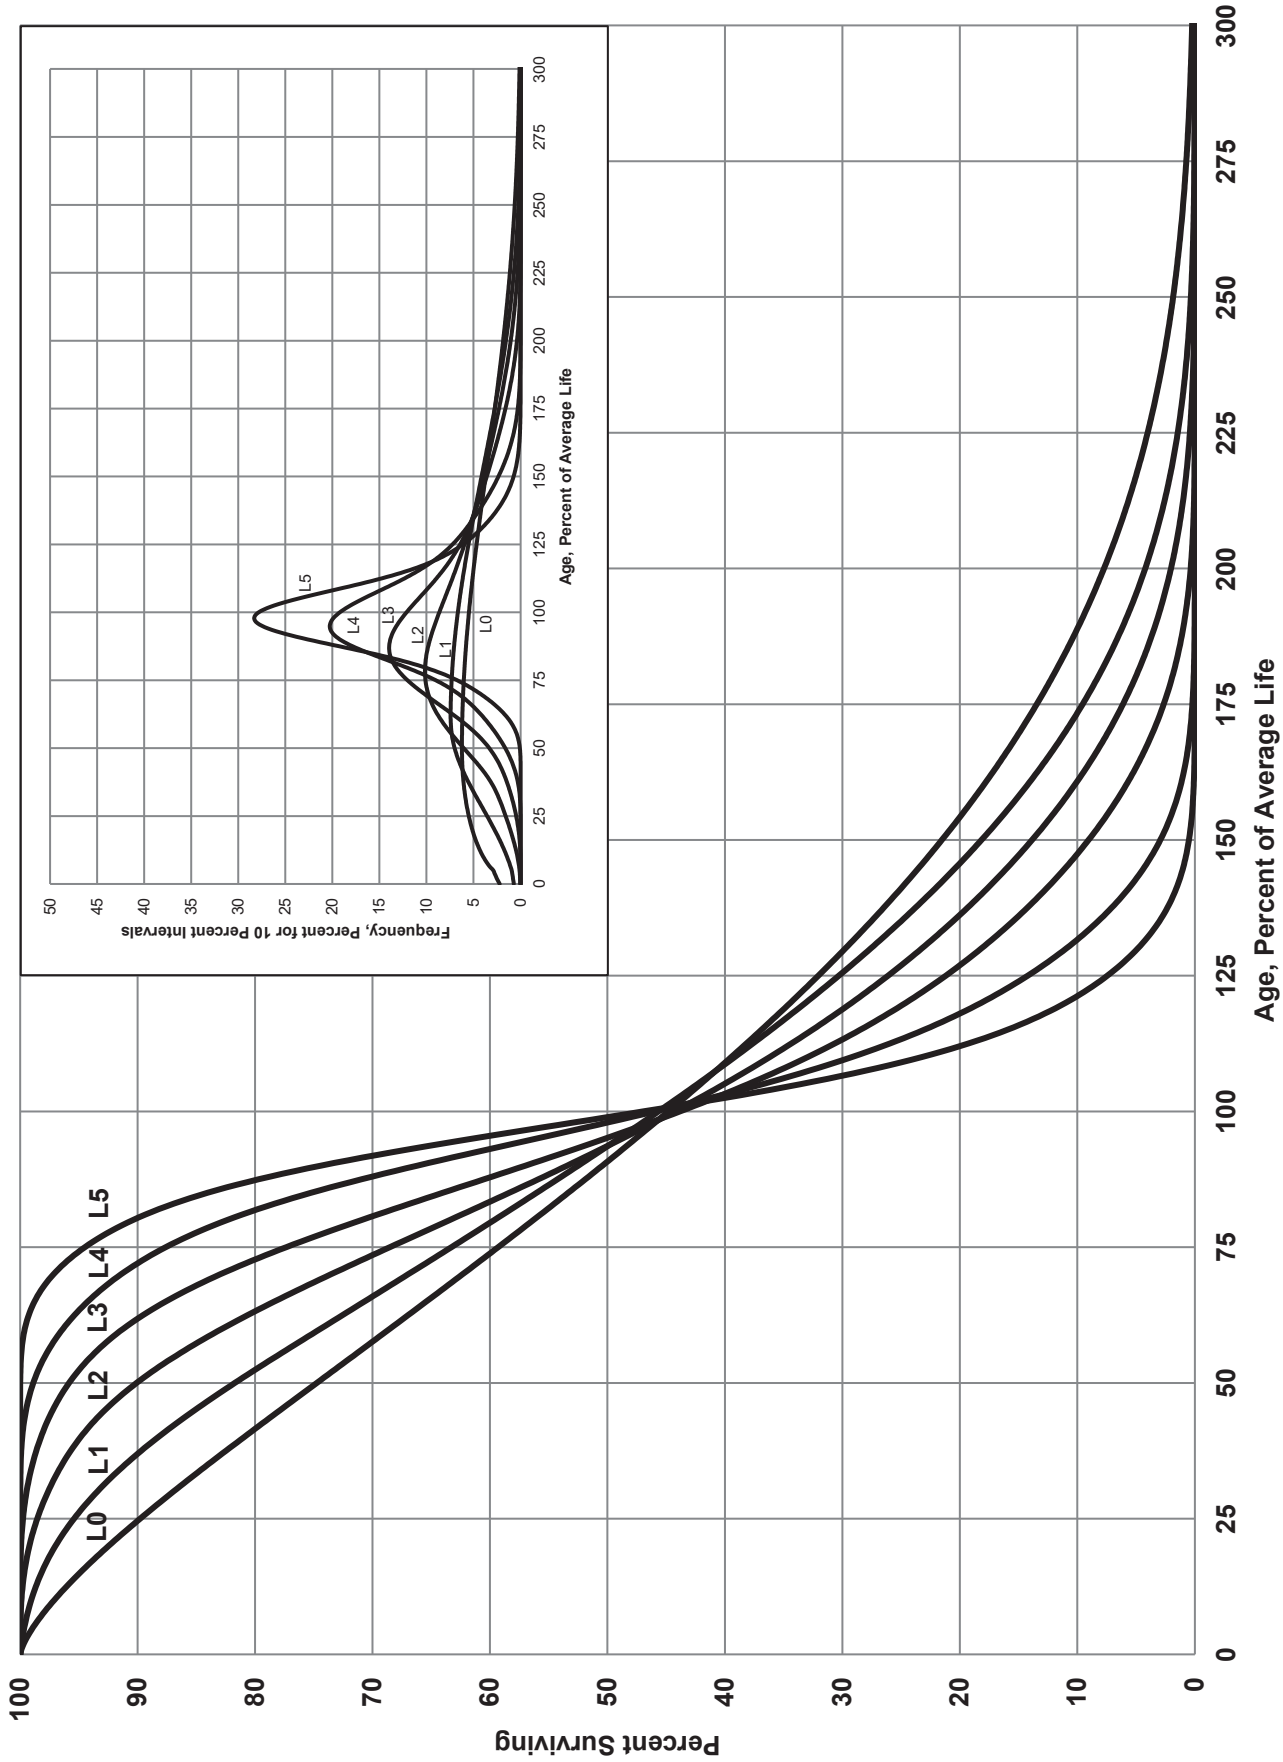

FIGURE 2.. LEFT MODAL OR "L" IOWA TYPE SURVIVOR CURVES

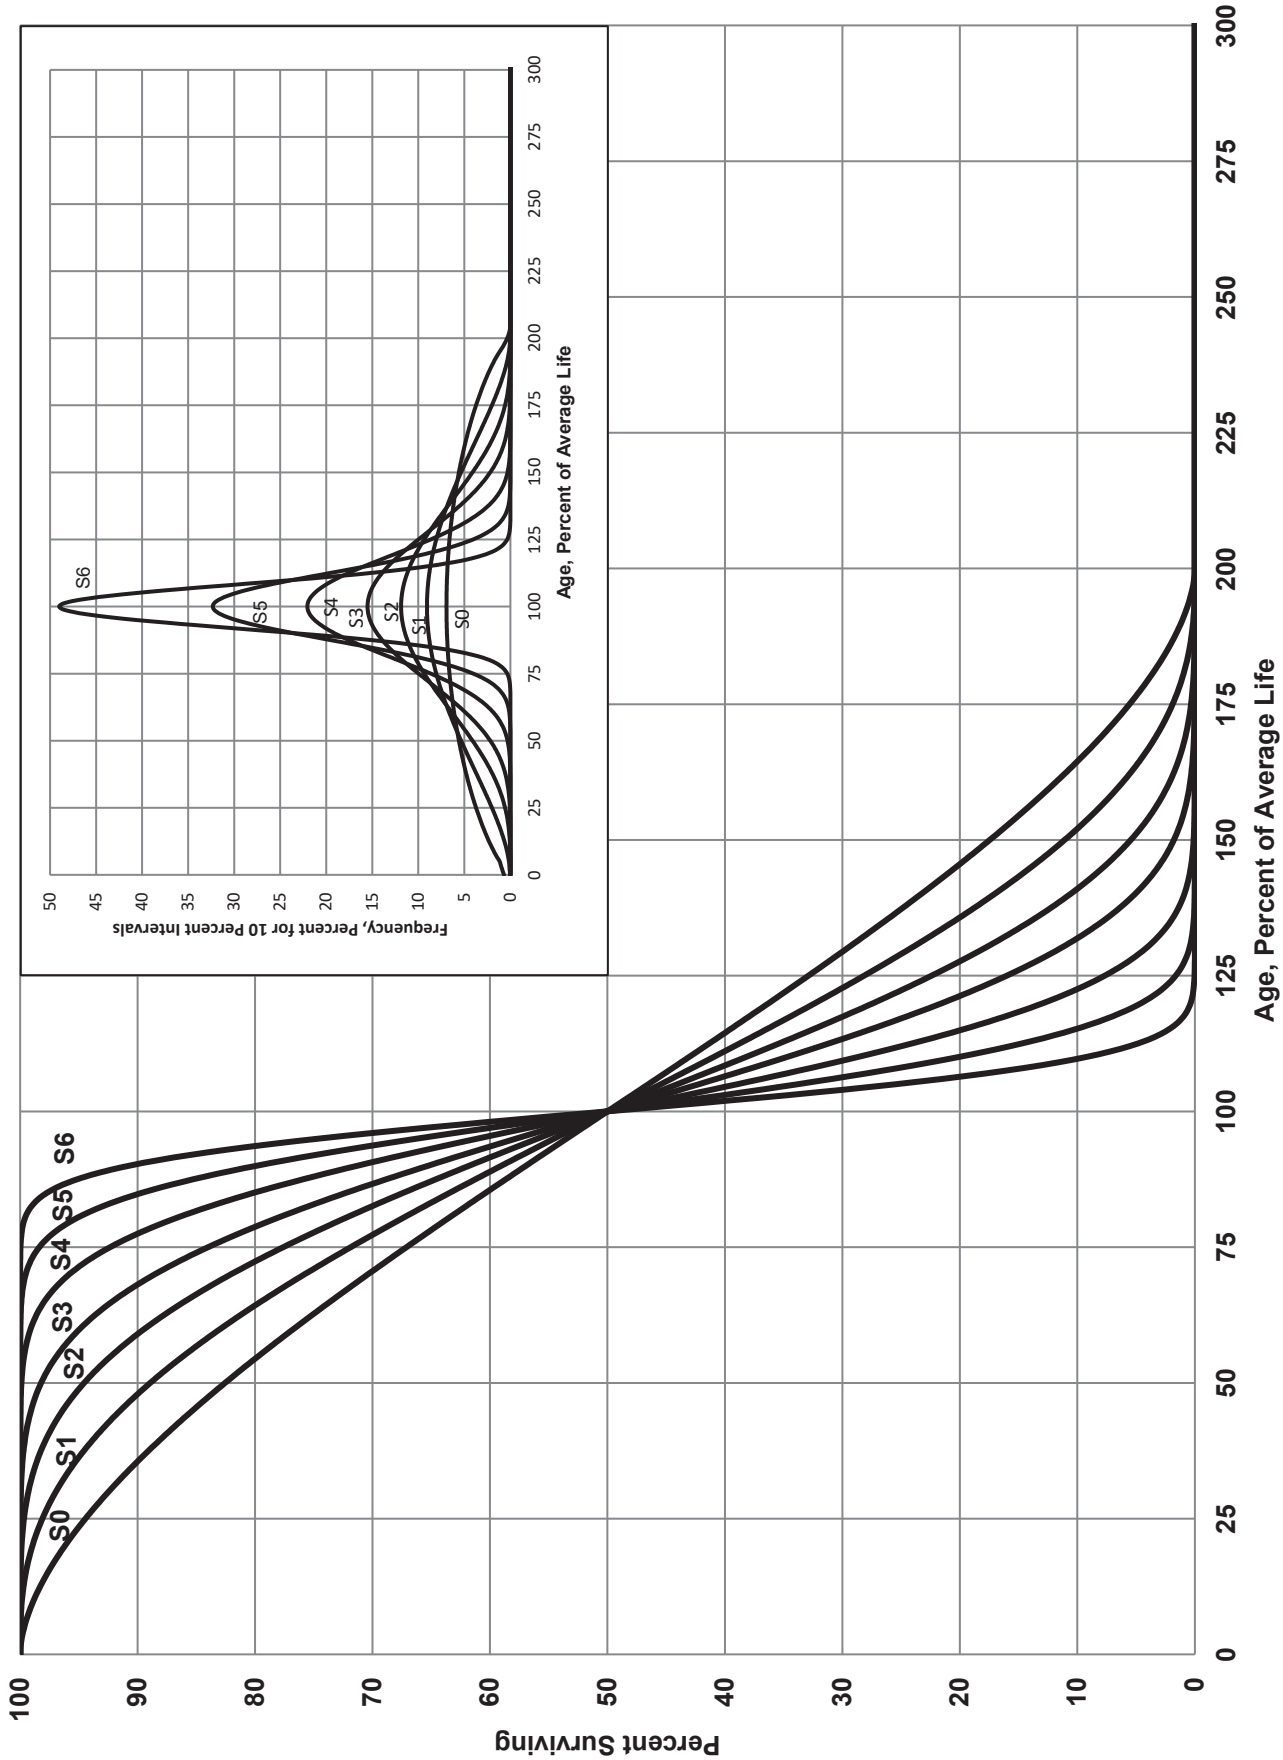

FIGURE 3.. SYMMETRICAL OR "S" IOWA TYPE SURVIVOR CURVES

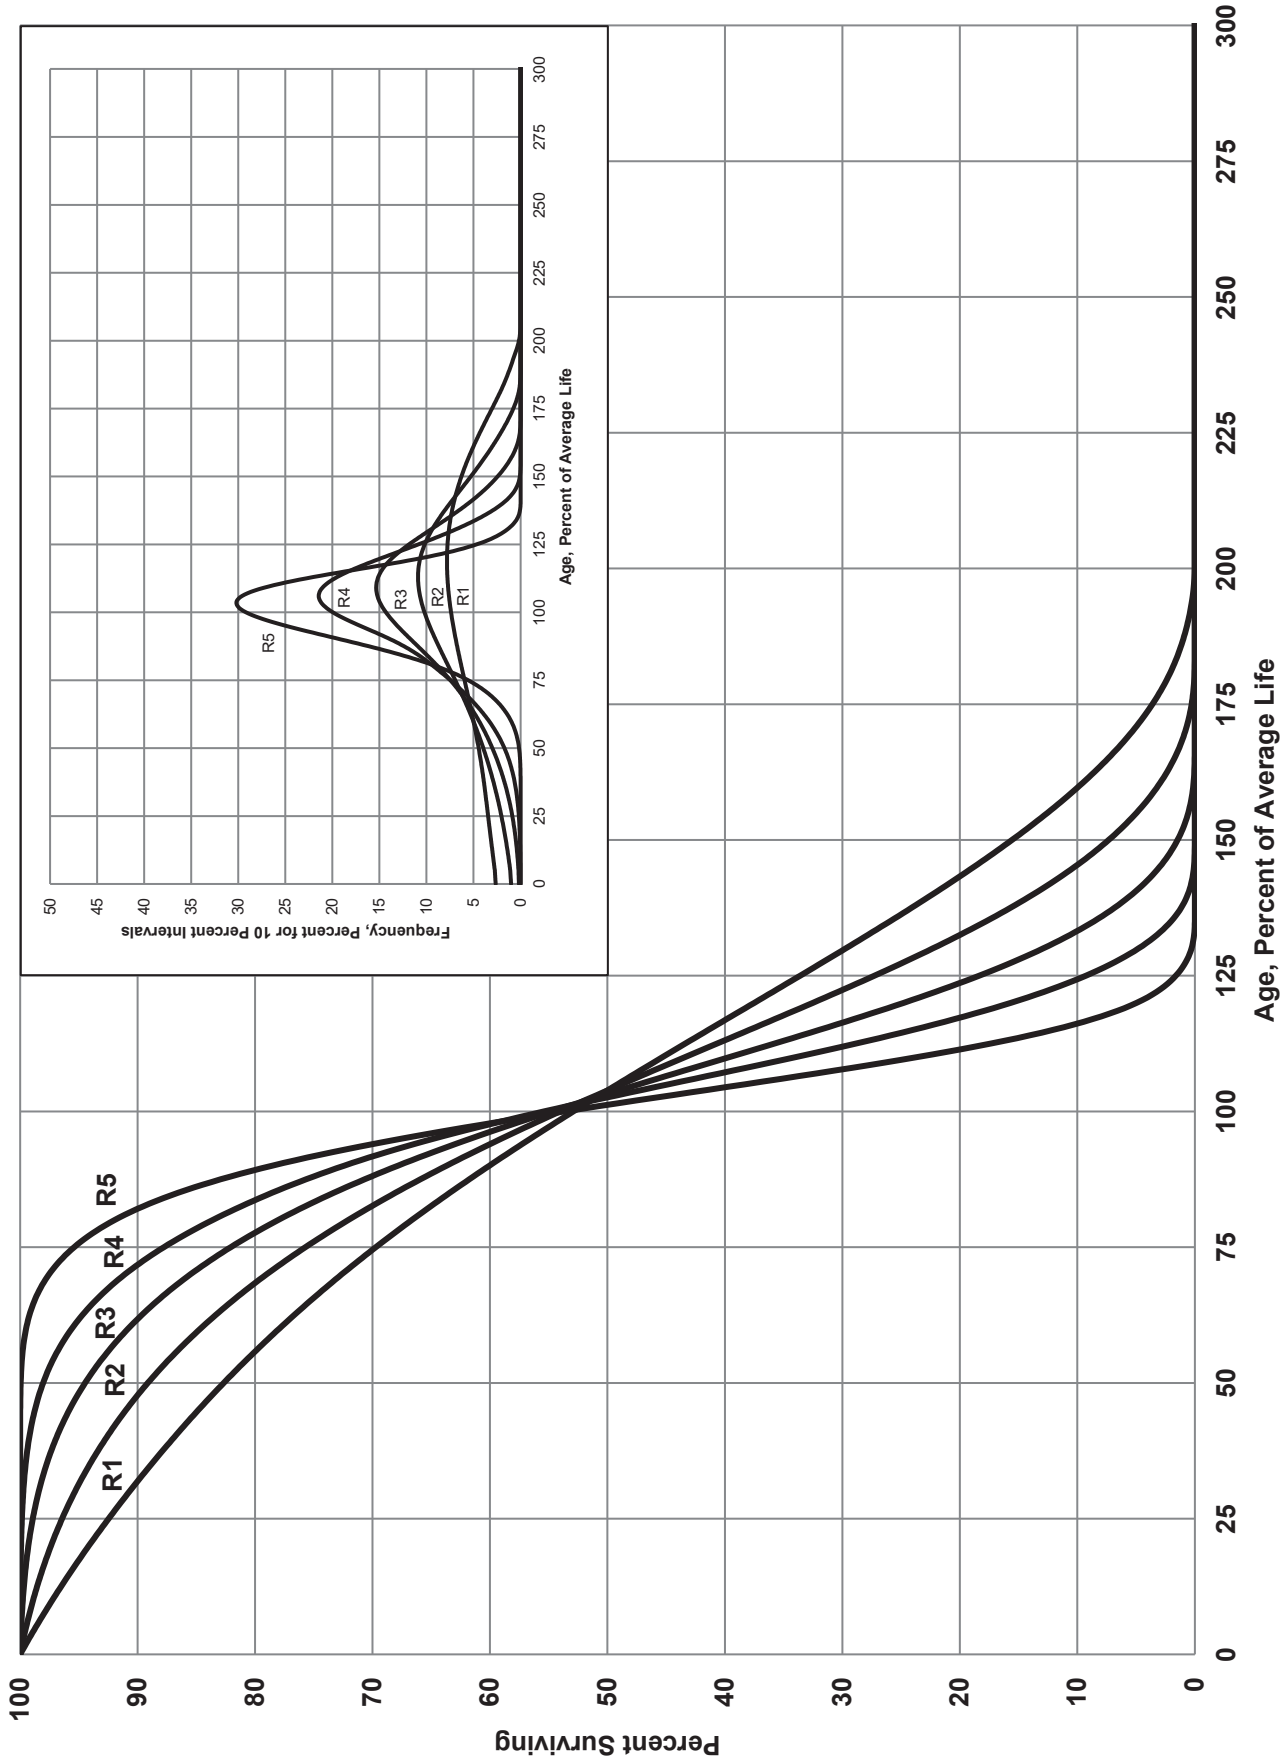

FIGURE 4.. RIGHT MODAL OR "R" IOWA TYPE SURVIVOR CURVES

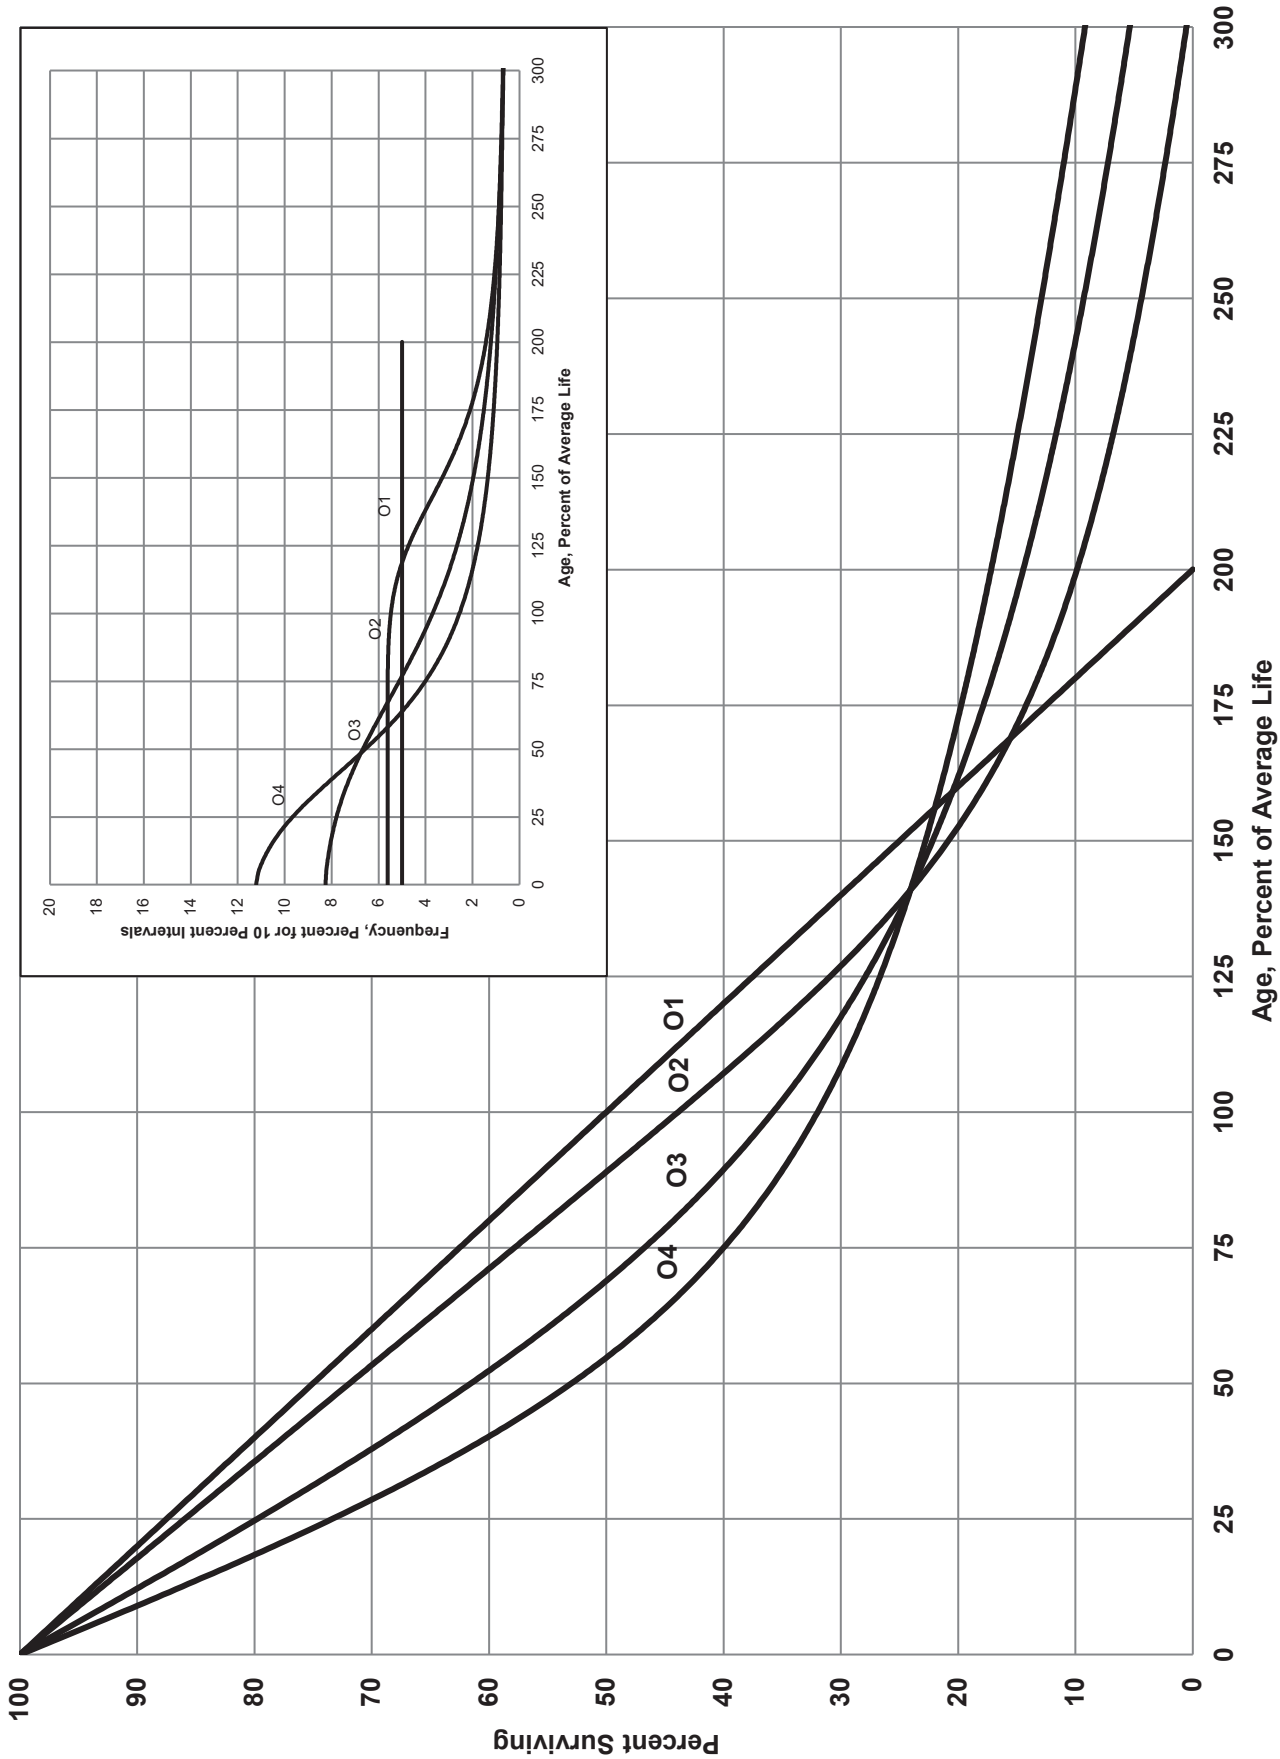

FIGURE 5. ORIGIN MODAL OR "O" IOWA TYPE SURVIVOR CURVES

These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[1] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text and is also explained in several publications including "Statistical Analyses of Industrial Property Retirements,"[2] "Engineering Valuation and Depreciation,"[3] and "Depreciation Systems."[4]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band. The band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2013-2022 for which there were placements during the years 2008-2022. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on pages II-11 and II-12. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 2008 were retired in 2013. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2013 retirements of 2008 installations and ending with the 2022 retirements of the 2017 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.

[a] Transfer Affecting Exposures at Beginning of Year

[b] Transfer Affecting Exposures at End of Year

[c] Sale with Continued Use

Parentheses Denote Credit Amount.

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on page II-14. The surviving plant at the beginning of each year from 2013 through 2022 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2018 are calculated in the following manner:

Exposures at age 0	= amount of addition	= $750,000
Exposures at age ½	= $750,000 - $ 8,000	= $742,000
Exposures at age 1½	= $742,000 - $18,000	= $724,000
Exposures at age 2½	= $724,000 - $20,000 - $19,000	= $685,000
Exposures at age 3½	= $685,000 - $22,000	= $663,000

Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a]Additions during the year

For the entire experience band 2013-2022, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on page II-16, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless.

SCHEDULE 4. ORIGINAL LIFE TABLE
CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2013-2022 Placement Band 2008-2022

(Exposure and Retirement Amounts are in Thousands of Dollars)

Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	Percent Surviving at Beginning of Age Interval

13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 Divided by Column 2.
Column 5 = 1.0000 Minus Column 4.
Column 6 = Column 5 Multiplied by Column 6 as of the Preceding Age Interval.

The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

PART III. SERVICE LIFE CONSIDERATIONS

PART III. SERVICE LIFE CONSIDERATIONS

FIELD TRIPS

In order to be familiar with the operation of the Company and observe representative portions of the plant, field trips have been conducted. A general understanding of the function of the plant and information with respect to the reasons for past retirements and the expected future causes of retirements are obtained during field trips. This knowledge and information were incorporated in the interpretation and extrapolation of the statistical analyses.

The following is a list of the locations visited during our field trip visits.

September 25-26, 2023
- PSEG Electric Training Center
- Metuchen Switching Station
- Pearson Switchyard
- Edison Substation
- Plainfield Substation
- Central Measuring and Regulating Station
- LPA Central Gas Plant
- New Central Measuring and Regulating Station
- Philo Regulating Station
- Woodbridge Measuring and Regulating Station
- New Brunswick Service Center

October 31, 2016
- Essex Substation
- Iron Bound Substation
- Port Street Substation
- Kuller Road Substation
- Great Notch Substation
- Clifton Service Center

SERVICE LIFE ANALYSIS

The service life estimates were based on judgment which considered a number of factors. The primary factors were the statistical analyses of data, current Company policies and outlook as determined during conversations with management; and the survivor curve estimates from previous studies of this company and other electric and gas utility companies.

For 20 plant accounts for which survivor curves were estimated, the statistical analyses using the retirement rate method contributed significantly to the estimated survivor curves. These accounts represent 86 percent of depreciable electric, gas and common plant. Generally, the information external to the statistics led to minimal or no significant departure from the indicated survivor curves for the accounts listed below. The statistical support for the service life estimates is presented in the section beginning on page VII-2.

ELECTRIC PLANT

DISTRIBUTION PLANT

361.00	Structures and Improvements
362.00	Station Equipment
365.00	Overhead Conductors and Devices
367.00	Underground Conductors and Devices
368.00	Line Transformers
370.00	Meters
373.00	Street Lighting and Signal Systems

GAS PLANT

PRODUCTION PLANT

305.00	Structures and Improvements
307.00	Other Power Equipment
320.00	Other Equipment

OTHER STORAGE PLANT

362.00	Gas Holders

TRANSMISSION PLANT

369.00	Measuring and Regulating Station Equipment

DISTRIBUTION PLANT

375.00	Structures and Improvements
376.00	Mains
380.00	Services
381.00	Meters
382.00	Meter Installations
383.00	House Regulators
384.00	House Regulator Installations
385.00	Industrial Measuring and Regulating Station Equipment

Electric Account 367, Underground Conductors and Devices, is used to illustrate the manner in which the study was conducted for the groups in the preceding list. Aged plant accounting data for this account have been compiled for the years 1976 through 2022. These data have been coded in the course of the Company's normal record keeping according to account or property group, type of transaction, year in which the transaction took place, and year in which the electric plant was placed in service. The retirements, other plant transactions, and plant additions were analyzed by the retirement rate method.

The survivor curve estimate is based on the statistical indications for the periods 1976-2022 and 1990-2022. The Iowa 58-R2 is a reasonable fit of the original survivor curve. The 58-year average service life is within the typical range of average service lives used in the industry. The 58-R2 is consistent with Company plans and the assets currently in service for this account

For Gas Plant, Account 376.00, Mains, is used to illustrate the manner in which the study was conducted. Aged plant accounting data have been compiled for the years 1975 through 2022. These data have been coded in the course of the Company's normal record keeping according to account or property group, type of transaction, year in which the transaction took place, and year in which the gas plant was placed in service. The retirements, other plant transactions, and plant additions were analyzed by the retirement rate method.

The survivor curve estimate is based on the statistical indications for the periods 1975-2022 and 1993-2022. The Iowa 75-R2.5 is reasonable fit of many of the data points of the original life table and incorporates that the life table drops to 0 percent surviving by about age 130. The 75-year service life is at the upper end of the typical

service life range of 55 to 75 years for mains. The 75-R2.5 survivor curve incorporates the Company's plans with regard to older types of pipes as well as service life expectations of newer plastic and steel mains.

The survivor curve estimates for the remaining accounts were based on judgment incorporating the statistical analyses and previous studies for this and other electric and gas utilities.

The selected amortization periods for most General Plant accounts are described in the section "Calculated Annual and Accrued Depreciation."

PART IV. NET SALVAGE CONSIDERATIONS

PART IV. NET SALVAGE CONSIDERATIONS

NET SALVAGE ANALYSIS

The estimates of net salvage by account were based in part on historical data compiled for the years 1977 through 2022 for electric plant and 1975 through 2022 for gas plant. Cost of removal and gross salvage were expressed as percents of the original cost of plant retired, both on annual and three-year moving average bases. The most recent five-year average also was calculated for consideration. The net salvage estimates by account are expressed as a percent of the original cost of plant retired.

Net Salvage Considerations

The estimates of future net salvage are expressed as percentages of surviving plant in service, i.e., all future retirements. In cases in which removal costs are expected to exceed salvage receipts, a negative net salvage percentage is estimated. The net salvage estimates were based on judgment which incorporated analyses of historical cost of removal and gross salvage data, expectations with respect to future removal requirements and markets for retired equipment and materials.

The analyses of historical cost of removal and gross salvage data are presented in the section titled “Net Salvage Statistics” for the plant accounts for which the net salvage estimate relied partially on those analyses.

Statistical analyses of historical data for the period 1977 through 2022 for electric plant and 1975 through 2022 for gas plant contributed significantly toward the net salvage estimates for 13 plant accounts, representing 90 percent of depreciable plant, as follows:

ELECTRIC PLANT

DISTRIBUTION PLANT

362.00	Station Equipment
364.00	Poles, Towers and Fixtures
365.00	Overhead Conductors and Devices
367.00	Underground Conductors and Devices
368.00	Line Transformers
369.00	Services
370.00	Meters
373.00	Street Lighting and Signal Systems

GAS PLANT

DISTRIBUTION PLANT

376.00	Mains
380.00	Services
381.00	Meters
382.00	Meter Installations
385.00	Industrial Measuring and Regulating Station Equipment

The analysis for Electric Plant Account 367.00, Underground Conductors and Devices, is used to illustrate the manner in which the study was conducted for most plant accounts. Net salvage data for the period 1977 through 2022 were analyzed for this account. The data include cost of removal, gross salvage and net salvage amounts and each of these amounts is expressed as a percent of the original cost of regular retirements. Three-year moving averages for the 1977-1979 through 2020-2022 periods were computed to smooth the annual amounts.

Cost of removal has varied throughout the forty-six year period but on average has been 69 percent of retirements. Cost of removal for the most recent five years averaged 63 percent. There has been gross salvage in many years for the account. Gross salvage has averaged 25 percent overall and averaged 3 percent in the most recent five years.

The net salvage percent based on the overall period 1977 through 2022 is negative 45 percent and based on the most recent five-year period is negative 60 percent.

Estimates for many other electric utilities for this account are in the negative 5 to negative 25 percent range, although there are many companies with more negative net salvage estimates. The net salvage estimate for PSEG in this account is negative 20, which is conservative when compared to the overall net salvage percent in the historical data, is within the range of other electric company estimates and is consistent with future expectations for this account.

For Gas Plant Account 376.00, Mains, is used to illustrate the manner in which the study was conducted. Net salvage data for the period 1975 through 2022 were analyzed for this account.

Cost of removal has varied throughout the forty-eight year period of available data but has been relatively high throughout the historical period studied. The overall average cost of removal is 63 percent, but recent years have been somewhat lower and the most recent five-year average is 41 percent. Gross salvage has been low throughout the forty-two year period. The overall average is 1 percent.

The average net salvage percent based on the overall period 1975 through 2022 is negative 62 percent and the most recent five-year average is 40 percent. Many estimates for other utilities are in the negative 10 to negative 30 percent range, but there are also estimates of negative 75 percent or higher. It is reasonable to expect that the Company would have higher removal costs than many other utilities, given factors such as a high density population and various work requirements in PSEG's service territory.

The net salvage percents for the remaining accounts were based on judgment incorporating estimates of other electric and gas utilities.

PART V. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART V. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

GROUP DEPRECIATION PROCEDURES

A group procedure for depreciation is appropriate when considering more than a single item of property. Normally the items within a group do not have identical service lives but have lives that are dispersed over a range of time. There are two primary group procedures, namely, average service life and equal life group. In the average service life procedure, the rate of annual depreciation is based on the average life or average remaining life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

Single Unit of Property

The calculation of straight line depreciation for a single unit of property is straightforward. For example, if a $1,000 unit of property attains an age of four years and has a life expectancy of six years, the annual accrual over the total life is:

$$\frac{\$1{,}000}{(4 + 6)} = \$100 \text{ per year.}$$

The accrued depreciation is:

$$\$1{,}000 \left(1 - \frac{6}{10}\right) = \$400.$$

Remaining Life Annual Accruals

For the purpose of calculating remaining life accruals as of December 31, 2022, the depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. Explanations of remaining life accruals and calculated accrued depreciation follow. The detailed calculations as of December 31, 2022, are set forth in the Results of Study section of the report.

Average Service Life Procedure

In the average service life procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the average remaining life of the vintage. The average remaining life is a directly weighted average derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future depreciation accruals if current forecasts of life characteristics are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each account based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$Ratio = 1 - \frac{Average\ Remaining\ Life}{Average\ Service\ Life}.$$

CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION

Amortization is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most of their service, the amortization period and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is proposed for a number of accounts that represent numerous units of property, but a very small portion of depreciable electric, gas and common plant in service. The accounts and their amortization periods are as follows:

Account		Amortization Period, Years
ELECTRIC PLANT		
391.10	Office Furniture	20
391.20	Office Equipment	4
391.31	Office Computer Equipment	7
392.10	Transportation Equipment 13,000 lbs and Under	9
392.20	Transportation Equipment Over 13,000 lbs	13
393.00	Stores Equipment	7
394.00	Tools, Shop and Garage Equipment	7
395.00	Laboratory Equipment	5
396.00	Power Operated Equipment	13
397.00	Communication Equipment	10
398.00	Miscellaneous Equipment	7

GAS PLANT

391.10	Office Furniture and Equipment	20
391.20	Office Equipment	4
391.30	Office Computer Equipment	7
391.33	Personal Computing Equipment	3
392.10	Cars and Light Trucks	9
392.20	Heavy Trucks and Truck Mounted Equipment	13
393.00	Stores Equipment	7
394.00	Tools, Shop and Garage Equipment	7
395.00	Laboratory Equipment	5
396.00	Power Operated Equipment	13
397.00	Communication Equipment	10
398.00	Miscellaneous Equipment	7

The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period. The annual amortization amount is determined by dividing the original cost by the period of amortization for the account.

PART VI. RESULTS OF STUDY

PART VI. RESULTS OF STUDY

QUALIFICATION OF RESULTS

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and net salvage and for the change of the composition of property in service. The annual accrual rates were calculated in accordance with the straight line remaining life method of depreciation, using the average service life procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

The annual depreciation accrual rates are applicable specifically to the electric, gas and common plant in service as of December 31, 2022. For most plant accounts, the application of such rates to future balances that reflect additions subsequent to December 31, 2022, is reasonable for a period of three to five years.

DESCRIPTION OF STATISTICAL SUPPORT

The service life and net salvage estimates were based on judgment which incorporated statistical analyses of retirement data, discussions with management and consideration of estimates made for other electric and gas utility companies. The results of the statistical analyses of service life are presented in the section titled "Service Life Statistics."

The estimated survivor curves for each account are presented in graphical form. The charts depict the estimated smooth survivor curve and original survivor curve(s),

when applicable, related to each specific group. For groups where the original survivor curve was plotted, the calculation of the original life table is also presented.

The analyses of net salvage data are presented in the section titled, “Net Salvage Statistics.” The tabulations present annual cost of removal and gross salvage data, three-year moving averages and the most recent five-year average. Data are shown in dollars and as percentages of original costs retired.

DESCRIPTION OF DEPRECIATION TABULATIONS

A summary of the results of the study, as applied to the original cost of electric, gas and common plant as of December 31, 2022, is presented in Tables 1 and 2 on pages VI-4 through VI-7 of this report. The schedule sets forth the original cost, the book reserve, future accruals, the calculated annual depreciation rate and amount, and the composite remaining life related to electric and gas plant.

The tables of the calculated annual depreciation accruals are presented in account sequence in the section titled "Detailed Depreciation Calculations." The tables indicate the estimated survivor curve and net salvage percent for the account and set forth, for each installation year, the original cost, the calculated accrued depreciation, the allocated book reserve, future accruals, the remaining life and the calculated annual accrual amount. Appendix A sets forth the detailed calculation of annual depreciation and annual accrual rates that includes the net normalization method for net salvage. The Appendix includes the calculated depreciation rates with no net salvage component then separately includes the net normalization component for each account.

Schedule JJS-2

JOHN SPANOS

DEPRECIATION EXPERIENCE

Q. Please state your name.

A. My name is John J. Spanos.

Q. What is your educational background?

A. I have Bachelor of Science degrees in Industrial Management and Mathematics from Carnegie-Mellon University and a Master of Business Administration from York College.

Q. Do you belong to any professional societies?

A. Yes. I am a member and past President of the Society of Depreciation Professionals and a member of the American Gas Association/Edison Electric Institute Industry Accounting Committee.

Q. Do you hold any special certification as a depreciation expert?

A. Yes. The Society of Depreciation Professionals has established national standards for depreciation professionals. The Society administers an examination to become certified in this field. I passed the certification exam in September 1997 and was recertified in August 2003, February 2008, January 2013, February 2018 and February 2023.

Q. Please outline your experience in the field of depreciation.

A. In June 1986, I was employed by Gannett Fleming Valuation and Rate Consultants, Inc. as a Depreciation Analyst. During the period from June 1986 through December 1995, I helped prepare numerous depreciation and original cost studies for utility companies in various industries. I helped perform depreciation studies for the following telephone companies: United Telephone of Pennsylvania, United Telephone of New Jersey, and Anchorage Telephone Utility. I helped perform depreciation studies for the following companies in

the railroad industry: Union Pacific Railroad, Burlington Northern Railroad, and Wisconsin Central Transportation Corporation.

I helped perform depreciation studies for the following organizations in the electric utility industry: Chugach Electric Association, The Cincinnati Gas and Electric Company (CG&E), The Union Light, Heat and Power Company (ULH&P), Northwest Territories Power Corporation, and the City of Calgary - Electric System.

I helped perform depreciation studies for the following pipeline companies: TransCanada Pipelines Limited, Trans Mountain Pipe Line Company Ltd., Interprovincial Pipe Line Inc., Nova Gas Transmission Limited and Lakehead Pipeline Company.

I helped perform depreciation studies for the following gas utility companies: Columbia Gas of Pennsylvania, Columbia Gas of Maryland, The Peoples Natural Gas Company, T. W. Phillips Gas & Oil Company, CG&E, ULH&P, Lawrenceburg Gas Company and Penn Fuel Gas, Inc.

I helped perform depreciation studies for the following water utility companies: Indiana-American Water Company, Consumers Pennsylvania Water Company and The York Water Company; and depreciation and original cost studies for Philadelphia Suburban Water Company and Pennsylvania-American Water Company.

In each of the above studies, I assembled and analyzed historical and simulated data, performed field reviews, developed preliminary estimates of service life and net salvage, calculated annual depreciation, and prepared reports for submission to state public utility commissions or federal regulatory agencies. I performed these studies under the general direction of William M. Stout, P.E.

In January 1996, I was assigned to the position of Supervisor of Depreciation Studies. In July 1999, I was promoted to the position of Manager, Depreciation and

Valuation Studies. In December 2000, I was promoted to the position as Vice-President of Gannett Fleming Valuation and Rate Consultants, Inc., in April 2012, I was promoted to the position as Senior Vice President of the Valuation and Rate Division of Gannett Fleming Inc. (now doing business as Gannett Fleming Valuation and Rate Consultants, LLC) and in January of 2019, I was promoted to my present position of President of Gannett Fleming Valuation and Rate Consultants, LLC. In my current position I am responsible for conducting all depreciation, valuation and original cost studies, including the preparation of final exhibits and responses to data requests for submission to the appropriate regulatory bodies.

Since January 1996, I have conducted depreciation studies similar to those previously listed including assignments for Pennsylvania-American Water Company; Aqua Pennsylvania; Kentucky-American Water Company; Virginia-American Water Company; Indiana-American Water Company; Iowa-American Water Company; New Jersey-American Water Company; Hampton Water Works Company; Omaha Public Power District; Enbridge Pipe Line Company; Inc.; Columbia Gas of Virginia, Inc.; Virginia Natural Gas Company National Fuel Gas Distribution Corporation - New York and Pennsylvania Divisions; The City of Bethlehem - Bureau of Water; The City of Coatesville Authority; The City of Lancaster - Bureau of Water; Peoples Energy Corporation; The York Water Company; Public Service Company of Colorado; Enbridge Pipelines; Enbridge Gas Distribution, Inc.; Reliant Energy-HLP; Massachusetts-American Water Company; St. Louis County Water Company; Missouri-American Water Company; Chugach Electric Association; Alliant Energy; Oklahoma Gas & Electric Company; Nevada Power Company; Dominion Virginia Power; NUI-Virginia Gas Companies; Pacific Gas & Electric Company; PSI Energy; NUI - Elizabethtown Gas Company; Cinergy Corporation – CG&E; Cinergy

Corporation – ULH&P; Columbia Gas of Kentucky; South Carolina Electric & Gas Company; Idaho Power Company; El Paso Electric Company; Aqua North Carolina; Aqua Ohio; Aqua Texas, Inc.; Aqua Illinois, Inc.; Ameren Missouri; Central Hudson Gas & Electric; Centennial Pipeline Company; CenterPoint Energy-Arkansas; CenterPoint Energy – Oklahoma; CenterPoint Energy – Entex; CenterPoint Energy - Louisiana; NSTAR – Boston Edison Company; Westar Energy, Inc.; United Water Pennsylvania; PPL Electric Utilities; PPL Gas Utilities; Wisconsin Power & Light Company; TransAlaska Pipeline; Avista Corporation; Northwest Natural Gas; Allegheny Energy Supply, Inc.; Public Service Company of North Carolina; South Jersey Gas Company; Duquesne Light Company; MidAmerican Energy Company; Laclede Gas; Duke Energy Company; E.ON U.S. Services Inc.; Elkton Gas Services; Anchorage Water and Wastewater Utility; Kansas City Power and Light; Duke Energy North Carolina; Duke Energy South Carolina; Monongahela Power Company; Potomac Edison Company; Duke Energy Ohio Gas; Duke Energy Kentucky; Duke Energy Indiana; Duke Energy Progress; Northern Indiana Public Service Company; Tennessee- American Water Company; Columbia Gas of Maryland; Maryland-American Water Company; Bonneville Power Administration; NSTAR Electric and Gas Company; EPCOR Distribution, Inc.; B. C. Gas Utility, Ltd; Entergy Arkansas; Entergy Texas; Entergy Mississippi; Entergy Louisiana; Entergy Gulf States Louisiana; the Borough of Hanover; Louisville Gas and Electric Company; Kentucky Utilities Company; Madison Gas and Electric; Central Maine Power; PEPCO; PacifiCorp; Minnesota Energy Resource Group; Jersey Central Power & Light Company; Cheyenne Light, Fuel and Power Company; United Water Arkansas; Central Vermont Public Service Corporation; Green Mountain Power; Portland General Electric Company; Atlantic City Electric; Nicor Gas Company; Black Hills Power; Black Hills Colorado Gas; Black Hills Energy Arkansas, Inc.; Black Hills Kansas

Gas; Black Hills Service Company; Black Hills Utility Holdings; Public Service Company of Oklahoma; City of Dubois; Peoples Gas Light and Coke Company; North Shore Gas Company; Connecticut Light and Power; New York State Electric and Gas Corporation; Rochester Gas and Electric Corporation; Greater Missouri Operations; Tennessee Valley Authority; Omaha Public Power District; Indianapolis Power & Light Company; Vermont Gas Systems, Inc.; Metropolitan Edison; Pennsylvania Electric; West Penn Power; Pennsylvania Power; PHI Service Company - Delmarva Power and Light; Atmos Energy Corporation; Citizens Energy Group; PSE&G Company; Berkshire Gas Company; Alabama Gas Corporation; Mid-Atlantic Interstate Transmission, LLC; SUEZ Water; WEC Energy Group; Rocky Mountain Natural Gas, LLC; Illinois-American Water Company; Northern Illinois Gas Company; Public Service of New Hampshire; FirstEnergy Service Corporation; Northeast Ohio Natural Gas Corporation; Blue Granite Water Company; Spire Missouri, Inc.; Dominion Energy South Carolina, Inc.; South FirstEnergy Operating Companies; Dayton Power and Light Company; Liberty Utilities; East Kentucky Power Cooperative; Bangor Natural Gas; Hanover Borough Municipal Water Works; West Virginia American Water Company; Evergy Metro; Evergy Missouri West; Granite State Electric; Bluegrass Water; The Borough of Ambler; Newtown Artesian Water Company and Connecticut Water Company.

My additional duties include determining final life and salvage estimates, conducting field reviews, presenting recommended depreciation rates to management for its consideration and supporting such rates before regulatory bodies.

Q. Have you submitted testimony to any state utility commission on the subject of utility plant depreciation?

A. Yes. I have submitted testimony to the Pennsylvania Public Utility Commission; the

Commonwealth of Kentucky Public Service Commission; the Public Utilities Commission of Ohio; the Nevada Public Utility Commission; the Public Utilities Board of New Jersey; the Missouri Public Service Commission; the Massachusetts Department of Telecommunications and Energy; the Alberta Energy & Utility Board; the Idaho Public Utility Commission; the Louisiana Public Service Commission; the State Corporation Commission of Kansas; the Oklahoma Corporate Commission; the Public Service Commission of South Carolina; Railroad Commission of Texas – Gas Services Division; the New York Public Service Commission; Illinois Commerce Commission; the Indiana Utility Regulatory Commission; the California Public Utilities Commission; the Federal Energy Regulatory Commission ("FERC"); the Arkansas Public Service Commission; the Public Utility Commission of Texas; Maryland Public Service Commission; Washington Utilities and Transportation Commission; The Tennessee Regulatory Commission; the Regulatory Commission of Alaska; Minnesota Public Utility Commission; Utah Public Service Commission; District of Columbia Public Service Commission; the Mississippi Public Service Commission; Delaware Public Service Commission; Virginia State Corporation Commission; Colorado Public Utility Commission; Oregon Public Utility Commission; South Dakota Public Utilities Commission; Wisconsin Public Service Commission; Wyoming Public Service Commission; the Public Service Commission of West Virginia; Maine Public Utility Commission; Iowa Utility Board; Connecticut Public Utilities Regulatory Authority; New Mexico Public Regulation Commission; Commonwealth of Massachusetts Department of Public Utilities; Rhode Island Public Utilities Commission and the North Carolina Utilities Commission.

Q. Have you had any additional education relating to utility plant depreciation?

A. Yes. I have completed the following courses conducted by Depreciation Programs, Inc.:

"Techniques of Life Analysis," "Techniques of Salvage and Depreciation Analysis," "Forecasting Life and Salvage," "Modeling and Life Analysis Using Simulation," and "Managing a Depreciation Study." I have also completed the "Introduction to Public Utility Accounting" program conducted by the American Gas Association.

Q. Does this conclude your qualification statement?

A. Yes.

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
MICHAEL J. ADAMS
SENIOR VICE PRESIDENT, CONCENTRIC ENERGY ADVISORS, INC.

I. INTRODUCTION AND WITNESS QUALIFICATIONS

Q. Please state your name and business address.

A. My name is Michael J. Adams. My business address is 293 Boston Post Road West, Suite 500, Marlborough, Massachusetts 01752.

Q. By whom are you employed and in what position?

A. I am a Senior Vice President with Concentric Energy Advisors, Inc. ("Concentric").

Q. Please describe Concentric.

A. Concentric is a management consulting and economic advisory firm focused on the North American energy and water industries. Concentric specializes in regulatory and litigation support, transaction-related financial advisory services, energy market strategies, market assessments, energy commodity contracting and procurement, economic feasibility studies, and capital market analyses and negotiations.

Q. What are your responsibilities in your current position?

A. As a Senior Vice President my responsibilities include assisting clients in identifying and addressing business issues. My primary areas of focus have been regulatory-, financial- and accounting-related issues.

Q. Please describe your education.

A. I have an MBA from the University of Illinois – Springfield and a Bachelor of Science in Accounting from Illinois College. I am a member of the American Institute of Certified Public Accountants and the Illinois Society of Certified Public Accountants.

Q. Please describe your qualifications.

A. I have over thirty-five years of direct experience in the public utility industry. I have worked for an investor-owned utility, a regulatory agency, and most recently as a consultant to the energy industry. I have managed and/or participated in a wide variety of consulting engagements. A statement of my background and qualifications is attached as Schedule MJA-LL-1.

Q. Have you ever testified in a regulatory proceeding?

A. Yes. I have provided expert testimony or reports before the Arizona Corporation Commission; Arkansas Public Service Commission; the Connecticut Public Utilities Regulatory Authority, the Federal Energy Regulatory Commission (FERC); the Georgia Public Service Commission; the Hawaii Public Utilities Commission; the Idaho Public Utilities Commission; the Illinois Commerce Commission; the Kentucky Public Service Commission; the Maine Public Utilities Commission; the Maryland Public Service Commission; the Massachusetts Department of Public Utilities; the Missouri Public Service Commission; the Montana Public Service Commission, the New Hampshire Public Utilities Commission; the New Mexico Public Regulation Commission; the State of New Jersey Board of Public Utilities; the Oklahoma Corporation Commission; the Ontario Energy Board; the Pennsylvania Public Utility Commission; Public Utilities Commission of the State of South Dakota; the Tennessee Public Utility

Commission; the Texas Public Utility Commission; the Virginia State Corporation Commission; and the West Virginia Public Service Commission.

My testimonies typically address issues related to affiliate transactions, cash working capital, cost of service/revenue requirement, shared services, accounting, cost allocations and/or regulatory policies and practices.

II. PURPOSE AND SCOPE

Q. What is the purpose of your direct testimony?

A. I have been asked by Public Service Electric and Gas Company ("PSE&G" or the "Company") to prepare and discuss a lead-lag study that was used to develop Cash Working Capital ("CWC") factors that were ultimately used to calculate the cash working capital requirements for the Company's electric and gas operations. I also discuss the analysis of the Company's net assets and liabilities, which are a separate source of working capital. The Company has included the results of the lead lag study and the net asset and liabilities analyses in its rate base. Discussion of the studies follow.

III. CASH WORKING CAPITAL

Q. Please define what you mean by the phrase "cash working capital requirement."

A. The cash working capital requirement is the amount of funds the Company is required tomaintain on hand to finance the day-to-day operations of the Company.

Q. Are you sponsoring any scheduless in this proceeding related to your analysis of pseg's cash working capital requirement?

A. Yes. Schedules MJA-LL-2 through MJA-LL-3 set forth the results of the lead lag study and Net Assets and Liabilities analyses, respectively. Schedules MJA-LL-6 to -MJA-LL-18 are the workpapers supporting the lead-lag study and Net Assets and Liabilities analyses, respectively. The schedules were prepared under my direction and supervision and are accurate and complete to the best of my knowledge and belief.

IV. LEAD-LAG STUDY

Q. For what period was the lead-lag study performed?

A. The lead-lag study analyzed the Company's cash transactions and invoices for the twelve months ended December 31, 2022. The leads and lags were applied to expense amounts for the Test Year.

Q. How should the results of the cash working capital analysis and the net assets and liabilities be treated for ratemaking purposes?

A. The cash working capital requirements calculated using the CWC factors from the lead-lag study and the results of the net assets and liabilities analyses should be included as part of PSE&G's electric and gas operations rate base for ratemaking purposes.

Q. Is the analysis of the revenue lags and expense leads typically referred to as a lead-lag study?

A. Yes. Cash working capital requirements are typically determined by lead-lag studies that are used to analyze the lag time between the date customers receive service and the date the customers' payments are available to the Company. This lag is offset by a lead time during which the Company receives goods and services but pays for them at a later date. The "leads" and "lags"

are both measured in days. The dollar-weighted lead and lag days are then divided by 365 to determine a daily CWC factor. The CWC factor is multiplied by the appropriate annual test year cash expenses to determine the amount of cash working capital required for operations. The resulting amount of cash working capital is included as part of the Company's rate base. The test year operating expenses to which the leads and lags were applied in this proceeding are described in the testimony of Company witness Mr. McFadden.

Q. What are the various leads and lags that were considered in the cash working capital analysis?

A. Two broad categories of leads and lags were considered: 1) lags associated with the collection of revenues owed to the Company ("revenue lags"); and 2) lead times associated with the payments for goods and services received by the Company, as well as the various taxes and other expenses paid by the Company ("expense leads").

Q. What is a revenue lag?

A. A revenue lag refers to the elapsed time between the delivery of the Company's product (i.e., electricity and/or gas) and its ability to use the funds received as payment for the delivery of the product.

Q. What is an expense lead?

A. An expense lead refers to the elapsed time from when a good or service is provided to the Company to the point in time when the Company pays for the good or service and the funds are no longer available to the Company.

Q. What was the source of information you employed to determine the leads and lags in your cash working capital analysis?

A. Information from the Company was utilized, including data from Accounts Receivables, Accounts Payable, Customer Service, Human Resources, Payroll, and Tax systems. The information derived from these sources, together with the analysis of specific transactions, led to the determination of the appropriate number of lead-lag days for PSE&G's New Jersey electric and gas operations.

A. Revenue Lag

Q. How was the revenue lag determined?

A. The revenue lag measures the number of days from the date service was rendered by the Company until the date payment was received from customers and such funds were deposited and available to the Company. In the calculation, the revenue lag was divided into four distinct components: 1) service lag; 2) billing lag; 3) collection lag; and 4) bank float. An explanation of each component of the revenue lag follows.

Q. What is meant by service lag?

A. The service lag refers to the number of days from the mid-point of the service period to the meter reading date for the service period. Using the mid-point methodology, the service lag was determined to be 15.21 days (365 days in the year divided by 12 months divided by 2).

Q. What is meant by billing lag?

A. Billing lag refers to the average number of days from the date on which the meter was read until the customer was billed. The billing lag was determined by analyzing the Company's

monthly billing schedules and meter reading records. The average billing lag was determined to be 1.72 days. Refer to Schedule MJA-LL-6 for the calculation of the billing lag.

Q. What is meant by collection lag?

A. The collection lag refers to the average amount of time from the date when the customer received a bill to the date that the Company received payment from its customer. For purposes of the cash working capital analyses, the Company's actual customer receivables during the twelve months ended September 30, 2023 were analyzed to determine the collection lag. Based on weighted average data from the Company and by considering accounts receivables balances by days aged, the average collection lag was determined to be 50.65 days. Due to potential impacts from the pandemic during the test period of the study, the twelve months ended September 30, 2023 was used to reflect current customer payment patterns post-pandemic.

Q. Explain the calculation of the Company's collection lag.

A. The Company's monthly accounts receivable data was categorized into aging "buckets" of 0-30 days, 31-60 days, 61-90 days, 91-120 days and 120+ days outstanding. For purposes of calculating the collection lag, it was assumed that the customers will pay their bills ratably over the month. Therefore, the midpoint of the first month was determined to be 15 days (*i.e.*, 30 divided by 2). The same assumption that customers will pay their bills ratably over the course of the month was applied to each aging bucket. It was further assumed that customers will pay their bills ratably over the course of the second month (the month that is 31-60 days after the bill was issued). Therefore, the midpoint of payments received 31-60 days after the bill was issued is 45 days (*i.e.*, 30 days outstanding from the first month plus the 15-day midpoint of the second month = 45 days). This same theory applies to the use of 75 days for payments that were received 61-90

days after the bill is issued as well as the use of 105 days for the 91-120 days period. Receivables outstanding for 120 days or longer were conservatively capped at 120 days. The accounts receivable dollars in each bucket were then multiplied by the midpoint of each bucket to calculate the collections lag. Refer to Schedule MJA-LL-7 for the calculation of the collections lag.

Q. What does bank float represent?

A. Bank float represents the elapsed time from when customers' payments were deposited at the bank to when such funds were available to the Company. Based upon an analysis of the availability of deposited funds in the months of February, March and April 2022, the bank float was determined to be 0.92 days. Refer to Schedule MJA-LL-7 for the calculation of the bank float lag.

Q. Please summarize the calculation of revenue lag days.

A. The overall revenue lag, by lag component, is summarized in the following table.

Revenue Lag by Component	
Service Lag	15.21
Billing Lag	1.72
Collections Lag	50.65
Bank Float	0.92
Total Lag	**68.50**

Q. Has the Company included Energy Sales Taxes in its revenues when determining its total revenue requirement?

A. Yes. New Jersey energy sales taxes are included as a separate line item added to the revenue requirement in the determination of the total revenue requirement. The New Jersey energy sales tax is included as part of the revenue requirement lag. Customers are billed the Energy Sales Tax, known as the Sales and Use Tax (SUT), by the Company and the Company remits the charges to the State. The Company is required to remit these dollars to the State in advance of their

collection and the timing difference between the remittance to the State and the collection from customers represents a working capital requirement.

B. Expense Leads

Q. What expense-related leads were considered in the lead-lag analysis?

A. Lead times associated with the following expense categories were considered in the lead-lag study: a) Salaries and Wages; b) Incentive Compensation; c) Pensions and Employee Benefits; d) Other O&M; e) Purchased Power and Gas Supply Costs; f) Taxes Other than Income Taxes; g) Federal and State Income Taxes; h) Interest on Long-Term Debt; i) Service Company Expenses; j) New Jersey Energy Sales Tax; and k) depreciation and amortization expense and operating income.

Q. Provide an explanation of the expense lead associated with the Company's salaries and wages including incentive compensation.

A. Considering PSE&G's various payroll periods (i.e., weekly and bi-weekly) and incentive compensation paid to employees, the salaries and wages expense lead was determined to be 25.38 days. Refer to Schedule MJA-LL-8 for the calculation of the salaries and wages expense lead.

Q. What employee benefits does the company provide to its empoyees and what are the expense leads associated with such benefits?

A. The Company provides benefits for its employee associated with medical, dental, group life insurance, disability (short-term disability and long-term disability), workers' compensation, other post-employment benefits ("OPEB"), pension and 401(k) matching. Using the amounts paid/contributed by the Company, the timing of the payments, and the period each payment was applied for each benefit category, the dollar-weighted expense lead for each of the benefits was determined to be as follows: medical 12.86 days; dental 2.94 days; group life insurance 15.03 days;

short-term and long-term disability 45.89 days; OPEB 0 days; pension 15.17 days; 401(k) matching 12.57 days and workers' compensation 1.63 days. Refer to Schedule MJA-LL-9 for the calculations of the individual employee benefits expense leads.

Q. What are "other O&M expenses" and how was the expense lead calculated for such expenses?

A. The Company engages in transactions with vendors for a variety of purposes including facility maintenance, system maintenance, customer service, as well as other services. Accounts payable data was analyzed in order to calculate a lead time associated with the payment for services related to other O&M activities. The analysis indicated that on average, invoices were paid by the Company 36.10 days after receipt. Where appropriate, this lead time includes a service lead time. Refer to Schedule MJA-LL-10 for the calculation of the Other O&M expense lead.

Q. What expense lead was applied to purchased power in the study?

A. The Company purchases power from two separate groups: Basic Generation Service ("BGS") suppliers and Non-Utility Generators ("Purchased Electric Power"). BGS is the Company's default supply obligation for all its customers that do not choose to obtain electric power from a third-party supplier. Purchased Electric Power requires the Company to purchase power from qualifying facilities that generate less than 20MW. Based on an analysis of the service periods and payment dates for the Company's purchase of power from the two separate groups during the period examined, a weighted expense lead of 35.83 days was determined. Refer to Schedule MJA-LL-11 for the calculation of the purchased power expense lead.

Q. What is the expense lead time associated with the Company's Natural Gas Expenses?

A. The Company purchases natural gas for distribution to its gas customers. Based on an examination of the service periods and payment dates for the Company's purchases of natural gas, a weighted expense lead time of 35.63 days was determined. Refer to Schedule MJA-LL-12 for the calculation of the natural gas expense lead..

Q. What are the various general taxes considered in the Cash working capital analysis?

A. The following general taxes were considered in the study: a) Real Estate Taxes; b) Payroll Taxes; and c) Newark City Tax. Each of the taxes are described below.

Q. Explain the lead days associated with each type of general taxes in the cash working capital analysis.

A. The treatment of each category of general taxes in the study is described below:

Real Estate Tax: The Company makes payments to various taxing authorities in the State of New Jersey. Taking the periods for which the tax is assessed, as well as the timing of the actual payment dates and amounts into consideration for the property tax payments, a dollar-weighted expense lead of negative 39.09 days was determined. Refer to Schedule MJA-LL-13 for the calculation of the Real Estate tax expense lead.

Payroll Tax: Based on an analysis of the pay periods and dates for the Company's payment of payroll taxes (FICA, social security/medicare, federal and state unemployment taxes), a weighted expense lead of 16.96 days was determined. Refer to Schedule MJA-LL-13 for the calculation of the Payroll tax expense lead.

Newark City Tax: Residents of Newark pay a flat city income taxon earned income in addition to the New Jersey state income tax and federal income tax. Non-residents who

work in Newark also pay a local income tax. This tax is imposed on employers. Based on the periods for which the tax is assessed, as well as the timing of the actual payment dates and amounts taken into consideration for the Newark City Tax a dollar-weighted expense lead of 75.46 days was calculated. Refer to Schedule MJA-LL-13 for the calculation of the Newark City tax lead.

Taking the above into account, a weighted average expense lead of 6.95 days was calculated for taxes other than income taxes.

Q. How did your study address federal income taxes?

A. The lead time associated with federal income tax payments was based on the provisions of the Internal Revenue Code which requires estimated tax payments of 25 percent of total income taxes due each quarter of the current year. The first quarter payment is due by April 15th, while the second, third and fourth quarter payments are due on June 15th, September 15th, and December 15th, respectively. Taking this schedule into consideration a lead time of 37.88 days for federal income taxes was determined. Refer to Schedule MJA-LL-14 for the calculation of the federal income tax expense lead.

Q. How did you address state income taxes?

A. The expense lead for state income taxes was calculated based on the statutory tax due dates for Corporation Business Tax. Estimated payments are due on the 15th day of April, May, June, and December. This resulted in a calculated expense lead of negative 47.25 days. Refer to Schedule MJA-LL-14 for the calculation of the state income tax expense lead.

Q. Please describe how lead times associated with the Company's long-term interest expenses were addressed by the study.

A. The Company made semi-annual interest payments on its long-term debt throughout the test year. Using the midpoints of the semi-annual service periods, a dollar-weighted lead of 91.8 days for long-term interest payments was determined. Refer to Schedule MJA-LL-15 for the calculation of the interest expense lead.

Q. Provide a description of how service company expenses were addressed by the study.

A. Using the monthly invoices for charges to PSE&G from PSEG Services Corporation, a weighted-average service company expense lead of 35.91 days was determined. Refer to Schedule MJA-LL-16 for the calculation of the service company expense lead.

Q. How did your study address New Jersey energy sales tax?

A. "Charges for utility service provided and usually billed by New Jersey's public utility energy companies also are subject to the 6.625% New Jersey Sales Tax. These charges have been fully subject to the New Jersey Sales Tax since January 1, 1998".[1] The lead time for the New Jersey energy sales tax was calculated based on the midpoint of the tax liability period to the payment date, weighted by the actual amount paid. This resulted in a lead time of negative 48.71 days. Refer to Schedule MJA-LL-17 for the calculation of the New Jersey Energy Sales tax expense lead.

[1] New Jersey Treasury, Division of Taxation. NJ Division of Taxation - New Jersey Sales and Use (state.nj.us)

Q. Did you include depreciation, amortization, and deferred tax expense in the lead-lag study?

A. Yes. PSEG has historically been authorized to apply an expense lead to expenses such as depreciation, amortization, and deferred tax expense. When these expenses reduce rate base, the Company is deprived of the return that investment in rate base affords. If there is a lag between the reduction in rate base and the receipt of revenues recovering the expense, a carrying cost is incurred by the Company for the time of the lag. As such, it is appropriate for these expenses to be part of a working capital allowance.

The lead-lag study includes depreciation, amortization, and deferred tax expenses with an expense lag of 15.2 days (i.e., based on the mid-month convention, 365/12/2). There remains a lag between when assets in rate base are reduced through depreciation and when the Company receives cash from ratepayers for services provided. Therefore, it is appropriate for the Company to be compensated for the use of cash to keep the Company whole.

Q. Was the topic of including depreciation in cash working capital a topic addressed by Robert L. Hahne in "Accounting for Public Utilities"?

A. Yes, it was.

Q. Please describe how Mr. Hahne concluded that depreciation should be handled in a lead-lag study.

A. Mr. Hahne stated as follows: [2]

> Depreciation expense reflects a zero lag. This zero lag is a noncash charge and therefore cannot produce a need for cash working capital.[3]

[2] *Accounting for Public Utilities*, Hahne, Robert L., Chapter 5, Section 5.04, Cash Working Capital.

[3] Id.

This noncash treatment is based on the assumptions that there is no cash outlay associated with depreciation costs that investor funding is not required to pay these expenses. In fact, there was a related cash outlay when the properties were built. The sequence of events is as follows:

1. Investor funds are expended to construct a facility;
2. The facility is used to provide services with concurrent recording of a portion of the costs as depreciation expense;
3. Customers are billed for the depreciation costs incurred; and
4. Customers pay their bills with cash outlays by investors, ends with cash recovery by investors. In the interim, investors are funding the provision of utility services, and such funding must be recognized in rate base.

As the expenses are recorded, equal revenues are *recoverable* from ratepayers as reimbursement to investors and the accumulated provisions are deducted from rate base. The rate base reduction presumes that *recovery* of the recorded depreciation reserves has occurred. If the presumed recovery actually existed, there would be no justification for inclusion of the depreciation expense in cash working capital. The *recovery* assumption, however, is not correct. When the depreciation expense is recorded, the recovery is in the form of an increase in the accounts receivable from customers. The expense is recorded in one period. The actual recovery occurs later (after the service, billing, and collection period recognized in other lead-lag components). In the interim, the investor has not realized the recovery of capital that is imputed by the deduction of recorded depreciation expense. The funds due and payable to investors are being held by ratepayers, and the ratepayers should reimburse the investors for the time value of unpaid amounts due.

Q. Has the BPU Historically included depreciation in the determination of regulated utilities' cash working capital requirements?

A. Yes. The BPU has historically approved the inclusion of depreciation in the determination of cash working capital. The Company's inclusion of depreciation in the determination of its cash working capital requirement is consistent with the BPU's previous treatment and decisions.

Q. If depreciation expense were correctly included in the cash working capital requirement, as you have proposed, is the Company's depreciation expense being recovered via the proposed cash working capital allowance?

A. No. Depreciation expense is **not** being recovered via the cash working capital allowance, nor is there a double recovery of the expense. It is merely the timing difference that by appropriately including depreciation in the cash working capital determination allows investors the opportunity to be fully and fairly compensated for investment in utility assets from the time cash is expended until the time cash is recovered from customers. The Board has hitorically approved the inclusion of non-cash items in the lead-lag study, such as depreciation expense.

Q. Is it your recommendation that the Company should be permitted to include depreciation expense in the cash working capital analysis at zero expense lead, as the BPU has allowed in prior rate proceedings?

A. Yes, it is. Such treatment is consistent with past BPU practice.

Q. Is it your recommendation that the Company should be permitted to include amortization in the same manner as depreciation?

A. Yes, it is. Including amortization expense and assigning a zero lead to the expense recognizes that investor funding occurred but it has not yet been recovered from customers.

Q. How was operating income treated in the lead-lag study?

A. Operating income was included in the lead-lag study with an expense lead of zero days.

Q. Please explain why operating income was included in the study with a zero day lead.

A. A zero day lead was assigned to operating income, or return on invested capital, because operating income is earned when service is provided to the Company's customers, and belongs to investors when earned. As shown in the calculation of the revenue lag, operating income is not collected when earned. Therefore, a zero day lag was assigned to operating income to reflect that the Company's income has not been recovered from customers.

Q. How was pension and OPEB expense treated in the cash working capital analysis?

A. The OPEB expense in the lead-lag study is calculated using a zero-day expense lead, because the ratepayer is receiving a benefit from PSE&G's inclusion of the net OPEB liability in the Net Assets and Liabilities analyses. Since part of pensions and OPEB are included in the Net Assets and Liabilities Analyses, Concentric considered how these expenses are booked and reflected in operating expenses. The lead days for pension expense do not include the cash contributions to the trust because the cash contribution is included in the Net Assets and Liabilities Analyses. The pension expense that is booked and reflected in operating expenses has a 15.17 lead day.

Q. Based upon the results of the lead-lag study and the level of expense sponsored by the company, what level of cash working capital requirements should be included in PSE&G's rate base?

A. PSE&G's cash working capital requirement was determined to be $577,618,364 for PSEG's electric operations. The cash working capital requirement for PSEG's gas operations is $344,066,223.

V. NET ASSETS AND LIABILITIES

Q. What does a net assets and liabilities analysis measure and how is it measured?

A. Under a net assets and liabilities analysis, certain liabilities are subtracted from particular assets. The difference in the liabilities and the assets is assumed to be the working capital requirement.

Q. What are the results of PSE&G's net assets and liabilities analyses?

A. Under a net assets and liabilities analysis, the assets require working capital while the liabilities are sources of working capital. The amounts in the selected assets and liabilities accounts are shown in Schedule MJA-LL-3. The amounts in these accounts were not considered when analyzing the leads and lags for operating expenses, but they have a direct relationship with the electric and gas distribution rate base of PSEG. The amounts included in current assets are other accounts receivable, special deposits, other prepayments, miscellaneous deferred debits and other post-retirement benefits.

Other miscellaneous accounts receivable are predominantly damage claims related to electric pole repairs, and other receivables such as billings for reimbursable repair work. Such expenditures are required to be made in the day-to-day operations of the Company, but are not charged to utility operations and therefore, were not included in the lead-lag study. These expenditures are eventually reimbursed by the State or other agencies. There is, however, a continuing working capital investment required for such expenditures until reimbursement is received.

Post-retirement benefits represent the asset/liability associated with the expense recognition of SFAS 106 and the associated recovery of costs from customers. This has significantly increased

the Other Post Retirement Benefits net asset/liability since the conclusion of the Company's last BPU approved base rate case and is primarily due to the liability account decreasing since 2018 by approximately $800 million. See the testimony of Company witness Mr. McFadden for details on ways the Company has reduced its liability.

Energy Sales Tax and prepayments to the State of New Jersey for annual sales tax liability have been excluded from this analysis as they are included in the lead-lag study. The only prepayment included in this analysis is credit facilities fees. Special deposits represent the Company assets created as a result of the cumulative effect of annual pension funding in excess of SFAS No. 87 (pension accounting) expense and the timing of non-qualified pension costs.

The liability section of Schedule MJA-LL-3 includes the recognition of OPEB benefits as previously discussed.

The majority of the accounts payable amount reflects the recording of payables for contractors and other material and supply ("M&S") inventories. Since the other M&S balance is included as a separate component of Working Capital, it is necessary to reduce Working Capital requirements by the amounts included in other M&S inventory, which have not been paid.

PSE&G's net assets and liabilities analysis, as shown on Schedule MJA-LL-3 is $348,093,735 for electric and $261,255,338 for gas.

VI. CONCLUSION

Q. Does this conclude your direct testimony?

A. Yes, it does.

MICHAEL J. ADAMS
SENIOR VICE PRESIDENT

Mr. Adams has over thirty-five years of direct experience in the public utility industry. He has worked for an investor-owned utility, a regulatory agency, and most recently as a consultant to the utility industry.

While employed by Illinois Power Company, Mr. Adams monitored project expenditures associated with gas and electric distribution, transmission, and generation capital projects.

While employed by the Illinois Commerce Commission, Mr. Adams initially evaluated the rate filings of regulated utilities and provided expert testimony regarding the reasonableness of the requests. Mr. Adams was subsequently charged with developing and managing a management and operations audit program to evaluate company management policies, procedures, and performance, as well as operational efficiency and effectiveness. Mr. Adams served as the Deputy Executive Director of the agency at the time of his departure. As a consultant, Mr. Adams has provided consulting services to regulatory agencies and regulated utilities on an array of operational and financial issues since 1995.

Prior to joining Concentric, Mr. Adams was a Managing Director of Navigant Consulting, Inc. Mr. Adams is a Certified Public Accountant, a graduate of Illinois College and holds an M.B.A. from the University of Illinois, Springfield.

Mr. Adams provides financial, regulatory, strategic, operational and litigation support to his energy clients. He has assisted clients with regulatory/legislative initiatives related to the approval and implementation of alternative regulation plans as well as the preparation and support of regulatory filings under alternative rate plans. Mr. Adams also provides advisory services in the areas of mergers and acquisitions. As a consultant, Mr. Adams has provided expert testimony or reports before State and Federal regulatory agencies.
