STATE OF NEW JERSEY
BOARD OF PUBLIC UTILITIES

In the Matter of the Petition of Public Service Electric and Gas Company for Approval of an Increase in Electric and Gas Rates and for Changes in the Tariffs for Electric and Gas Service, B.P.U.N.J. No. 17 Electric and B.P.U.N.J. No. 17 Gas, and for Changes in Depreciation Rates, Pursuant to N.J.S.A. 48:2-18, N.J.S.A. 48:2-21 and N.J.S.A. 48:2-21.1, and for Other Appropriate Relief

BPU Docket Nos. _____

DIRECT TESTIMONY
OF
STEPHEN SWETZ

SENIOR DIRECTOR – CORPORATE RATES AND REVENUE REQUIREMENTS
ON
ELECTRIC COST OF SERVICE AND RATE DESIGN

December 29, 2023
P-9E

TABLE OF CONTENTS

SCOPE OF TESTIMONY ..... - 1 -

SCHEDULE INDEX ..... - 3 -

OVERVIEW OF THE COMPANY'S RATE FILING AND BASIS OF CALCULATIONS AND ANALYSES ..... - 5 -

Overview ..... - 5 -

Residential Rate Affordability ..... - 7 -

Weather Normalization of Billing Determinants ..... - 15 -

Scope of the Cost of Service Study ..... - 15 -

Adjustments to Accounting Data ..... - 16 -

COST OF SERVICE STUDY ("COSS") OVERVIEW ..... - 16 -

Introduction ..... - 16 -
Cost Allocation Concepts ..... - 17 -
General Cost Allocation and Functionalization Methodology ..... - 18 -
Functionalization of the Six Segments ..... - 23 -
Access Segment ..... - 24 -
Local Delivery Segment ..... - 25 -
System Delivery Segment ..... - 26 -
Street Lighting Segment ..... - 27 -
Customer Service Segment ..... - 27 -
Measurement Segment ..... - 28 -
Modeling Procedures ..... - 28 -
Synchronizing the Cost of Service Study to the Rate Design ..... - 29 -

RATE DESIGN ..... - 31 -

Introduction ..... - 31 -

Limitations on Rate Changes ..... - 32 -

Inter Class Revenue Increase Allocations ..... - 33 -
General Rate Design Principles and Methodology ..... - 34 -

RATE SCHEDULE SPECIFIC CHANGES..... - 37 -

Rate Schedule Residential Service ("RS") ..... - 37 -
Rate Schedule Residential Heating Service ("RHS")..... - 39 -
Rate Schedule Residential Load Management Service ("RLM") ..... - 41 -
Rate Schedule Water Heating Service ("WH") ..... - 42 -
Rate Schedule Water Heating Storage Service ("WHS")..... - 42 -
Rate Schedule Building Heating Service ("HS")..... - 43 -
Rate Schedule General Lighting And Power Service ("GLP") ..... - 43 -
Rate Schedule Large Power And Lighting Service ("LPL")..... - 45 -
Rate Schedule High Tension Service ("HTS")..... - 46 -
Payment Schedule Purchased Electric Power ("PEP")..... - 47 -

ELECTRIC VEHICLE ("EV") COST OF SERVICE STUDIES ("COSS")..... - 47 -

Residential Study..... - 47 -

Commercial & Industrial ("C&I") EV COSS..... - 48 -

PROPOSED RESIDENTIAL TOU RATES..... - 49 -

Overview ..... - 49 -

Rate Design Detail..... - 50 -

Program Details..... - 53 -

PROPOSED DCFC DISTRIBUTION KILOWATT-HOUR CHARGE..... - 57 -

STREETLIGHTING CHANGES..... - 58 -

LED Street Lighting..... - 58 -
Rate Schedule Body Politic Lighting Service ("BPL")..... - 60 -
Rate Schedule Body Politic Lighting Service From Publicly Owned Facilities ("BPL-POF") ..... - 62 -
Rate Schedule Private Street and Area Lighting Service ("PSAL") ..... - 63 -

RATE DESIGN FOR FUTURE ADJUSTMENT BETWEEN BASE RATE CASES..... - 64 -

TAX ADJUSTMENT CREDIT ("TAC")..... - 65 -

DISTRIBUTION ADJUSTMENT CHARGE AND STORM RECOVERY CHARGE ("SRC")- 66 -

SRC Mechanism..... - 66 -

SRC Components..... - 67 -

TARIFF CHANGES..... - 69 -

LOSSES..... - 69 -

CLEAN ENERGY FUTURE – ELECTRIC VEHICLE ("CEF-EV") FUTURE RATE ADJUSTMENT MECHANISM..... - 69 -

STAFF COSS METHODOLOGY..... - 75 -

Accounts E360 to E362, E365, E366, E367 and E368..... - 78 -
Accounts C389 to C399 – Common Plant and E303 Intangible Plant..... - 78 -
Accounts E902 – Meter Reading Expenses & E903 - Customer Records and Collection..... - 79 -
Subsequent Base Case Requirements..... - 79 -

APPENDIX E1 - DETAILED REVIEW OF COST OF SERVICE STUDY..... - 80 -

ALLOCATOR NAMING CONVENTION..... - 80 -

Direct Allocators..... - 80 -
Indirect Allocators..... - 81 -

ALLOCATION DETAILS..... - 82 -

Intangible Plant..... - 82 -
Production Plant..... - 82 -
Transmission Plant..... - 82 -
Distribution Plant..... - 82 -
E370 - Meters..... - 87 -
E373 – Street Light and Signal Systems..... - 88 -
Asset Retirement Obligations..... - 88 -
General, Common and Other Plant..... - 88 -

Depreciation Reserve ..... - 89 -
Adjustments to Develop Rate Base ..... - 89 -
Operating Revenues ..... - 90 -
Production Expenses ..... - 90 -
Transmission O&M Expenses ..... - 91 -
Distribution O&M Expenses ..... - 91 -
Customer Accounts, Service and Sales Expense ..... - 91 -
Administrative and General ("A&G") Expenses ..... - 92 -
Depreciation and Amortization Expenses ..... - 92 -
Pro Forma Expense Adjustments ..... - 92 -
Taxes ..... - 93 -

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
STEPHEN SWETZ
SENIOR DIRECTOR – CORPORATE RATES AND
REVENUE REQUIREMENTS
ON
ELECTRIC COST OF SERVICE AND RATE DESIGN

Q. Please state your name, affiliation and business address.

A. My name is Stephen Swetz, and I am the Senior Director – Corporate Rates and Revenue Requirements for PSEG Services Corporation. My principal place of business is 80 Park Plaza, Newark, New Jersey 07102. My credentials are set forth in the attached Schedule SS-El.

Q. Please describe your responsibilities as Senior Director - Corporate Rates and Revenue Requirements.

A. In this position I have, among other things, responsibility for the development of rates and tariffs for Public Service Electric and Gas Company ("PSE&G" or "Company").

Q. Have you previously testified in proceedings before the New Jersey Board of Public Utilities ("Board" or "BPU")?

A. Yes. I have both submitted written testimony and testified live before the BPU in a number of proceedings that are identified in Schedule SS-E1.

SCOPE OF TESTIMONY

Q. What is the purpose of your direct testimony in this proceeding?

A. The purpose of my direct testimony is to support the Company's proposed changes to its rates for Electric Service, which are designed to recover the revenue requirements for the electric distribution business as presented in this filing. My testimony provides the Company's embedded cost of service study ("Company COSS") used as the basis for development of the

new electric rates and the proposed rate design for each rate schedule in PSE&G's Electric Tariff. I also present an alternative embedded cost of service study ("the Staff COSS") as required under the 2018 Rate Case Order, and explain why that COSS should not be used to set rates in this case.[1]

Additionally, I sponsor other studies and modifications to the Company's Tariff for Electric Service ("Tariff") including the following:

- The establishment of a Storm Recovery Charge ("SRC") to recover major storm costs as a component of a proposed Distribution Adjustment Charge ("DAC") that was previously proposed as part of the COVID-19 cost recovery proceeding;[2]
- The results of Residential and Commercial & Industrial Electric Vehicle ("EV") Cost of Service Studies that were required by the CEF-EV Order.[3] As a result of these COSSs, the Company proposes the following:
    - A Residential Time of Use ("TOU") Program and associated Rate Schedules; and

[1] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of an Increase in Electric and Gas Rates and for Changes in Tariffs for Electric and Gas Service, B.P.U.N.J. No. 16 Electric and B.P.U.N.J. No. 16 Gas, and for Changes in Depreciation Rates, Pursuant to N.J.S.A. 48:2-18, N.J.S.A 48:2-21 and N.J.S.A. 48:2-21.1, and for Other Appropriate Relief*, BPU Docket Nos. ER18010029 & GR18010030; *I/M/O the New Jersey Board of Public Utilities' Consideration of the Tax Cuts and Jobs Act of 2017*; BPU Docket No. AX18010001; *I/M/O Public Service Electric and Gas Company for Approval of Revised Rates (Effective on an Interim Basis April 1, 2018) to Reflect the Reduction Under the Tax Cuts and Jobs Act of 2017*, BPU Docket No. ER18030231, Decision and Order Adopting Initial Decision and Stipulation (October 29, 2018) (the "2018 Rate Case Order"), paragraph 25.

[2] *I/M/O the New Jersey Board of Public Utilities Response to the COVID-19 Pandemic*, BPU Docket No. AO20060471, PSE&G filing titled *I/M/O the Petition of Public Service Electric and Gas Company for Approval of Incremental COVID-19 Costs for Recovery Through a New Special-Purpose Clause, and for Authorization to Recover Uncollectible Costs for Gas Through the Societal Benefits Charge* (July 17, 2023).

[3] *I/M/O the Petition of Public Service Gas and Electric Co. for Approval of its Clean Energy Future – Electric Vehicle and Energy Storage ("CEF-EVES") Program on a Regulated Basis*, B.P.U. Docket No. EO18101111, Decision and Order Approving Stipulation (January 27, 2021) ("CEF-EV Order").

- An optional Direct Current Fast Charge ("DCFC") Distribution kWh Charge to replace corresponding Distribution kW Charges for premises that solely serve DCFC charging facilities;

- Permit residential TOU rates (RLM or proposed RS-TOU) to serve residential EV charging at non-residential premises (such as a detached garage on a residential property);
- Changes to Streetlighting Rate Schedules, which makes Light Emitting Diode ("LED") luminaires the default offering and closes Non-LED luminaires for new installations; and
- Tax Adjustment Credit ("TAC") modifications.

I also sponsor the Company's proposed Tariff, which is attached to the Company's transmittal letter as Schedule 1.

SCHEDULE INDEX

Q. Do you sponsor any schedules as part of your direct testimony?

A. Yes. I sponsor the following schedules that were prepared and/or compiled by me or under my direction and supervision:

SCHEDULE DESCRIPTION	NUMBER
Qualifications of Stephen Swetz	SS-E1
Basis of Calculations Schedules	
Actual and Weather Normalized Billing Determinants	SS-E2
COSS Adjustments	SS-E3
Cost of Service Schedules	
Illustration of Cost Segmentation Methodology	SS-E4

Details of Complete Company COSS Study SS-E5
COSS Summary Report by Functional Segment SS-E6
COSS Revenue Requirements by Rate and Function SS-E7
Sync with Rate Design SS-E8
Rate and Rate Design Schedules
Inter Class Revenue Increase Allocations.....SS-E9
Service Charge Calculations SS-E10
Proof of Revenue by Rate Schedule SS-E11
Comparison of Typical Bills.....SS-E12
Staff's Cost Allocation Methodology Related Schedules
Details of Complete COSS Study – Staff's Method.....SS-E13
Summary Report – by Functional Segment – Staff's Method.....SS-E14
Functional Cost Summary – Staff's Method SS-E15
Service Charge Calculations – Staff's Method.....SS-E16
Tax Adjustment Credit (TAC) Schedules
TAC Revenue Requirement and Rate Calculations.....SS-TAC-1-6E
SRC Schedules
SRC Balance and Rate Calculations SS-SRC-1-3E
EV Cost of Service Studies Schedules
Residential Electric Vehicle COSS.....SS-EV-1
Commercial & Industrial Electric Vehicle COSSS SS-EV-2
CEF-EV Rate Adjustment Schedule.....SS-CEF-EV-1

OVERVIEW OF THE COMPANY'S RATE FILING AND BASIS OF CALCULATIONS AND ANALYSES

Overview

Q. What terminology does your direct testimony use regarding revenue and rates?

A. Throughout this testimony, the revenue or percentage increase for "Distribution" is based only on revenue from the Service Charge and the kilowatt-hour ("kWh") and per kilowatt ("kW") Distribution Charge(s) indicated in the particular rate schedule. The term "Delivery" refers to revenue from the Service Charge and Distribution Charges as indicated on the particular rate schedule, plus the revenue from all of the applicable adjustment clauses. The "Total Bill" equals the Delivery Charges plus electric supply, and is calculated as if all customers were supplied on Basic Generation Service ("BGS").

Q. Please describe the electric distribution services provided by the Company.

A. The Company provides electric distribution services under the following Rate Schedules:

(i) Rate Schedule RS is the Company's primary residential rate schedule;

(ii) Rate Schedule RHS is a closed service that was available to residential customers where electricity was the sole source of heating;

(iii) Rate Schedule RLM is a time of use rate available to residential customers;

(iv) Rate Schedule WH is a closed service that was available to premises with controlled water heating installations;

(v) Rate Schedule WHS is available for controlled water heating storage or for the electric heating elements of a water heating service connected to an active solar collection system;

(vi) Rate Schedule HS is a closed service that was available to permanently installed comfort building heating equipment;

(vii) Rate Schedule GLP is for general purposes at secondary distribution voltages;

(viii) Rate Schedule LPL is for general purposes at secondary voltages where the customer's measured peak demand exceeds 150 kW and also at primary distribution voltages;

(ix) Rate Schedule HTS is for general purposes at subtransmission, transmission and high voltages;

(x) Payment Schedule PEP is applicable to electricity produced from a Qualifying Facility as defined in the Public Utility Regulatory Policies Act of 1978 and delivered to the Company;

(xi) Rate Schedule BPL is service for dusk to dawn street lighting and area lighting to a body politic from Company-owned lighting facilities;

(xii) Rate Schedule BPL-POF is a closed service for dusk to dawn street lighting and area lighting to a body politic from publicly-owned lighting facilities; and

(xiii) Rate Schedule PSAL is service for dusk to dawn private street lighting and outdoor area lighting from Company-owned lighting facilities.

Q. Please provide an overview of the Company's filing in this proceeding.

A. As described more fully by Company witness Mr. Michael McFadden, PSE&G is seeking to increase its base distribution rates by approximately $522.1 million annually for its electric distribution business. Included in this filing, and as discussed further by Mr. McFadden and Company witness Mr. Cliff Pardo, the Company proposes to make certain modifications to the Company's TAC, including flowing back Mixed Service deductions to customers. This change will reduce electric rates by approximately $98.2 million annually. In addition, the Company is proposing the SRC to recover major storm costs, increasing rates by

approximately $38.0 million annually. My testimony provides support on how these changes will impact rates.

Residential Rate Affordability

Q. How have your Electric distribution rates changed since the 2018 base rate case?

A. The distribution component of a Residential Electric customer bill for a customer using 7,800 kWh per year has increased at a CAGR of 1.5%, well below the statewide comparable average of 5.0%. and below inflation levels. This modest increase is driven primarily by rate increases from the ES II Program to modernize the Company's electric system and to make it more reliable and resilient.

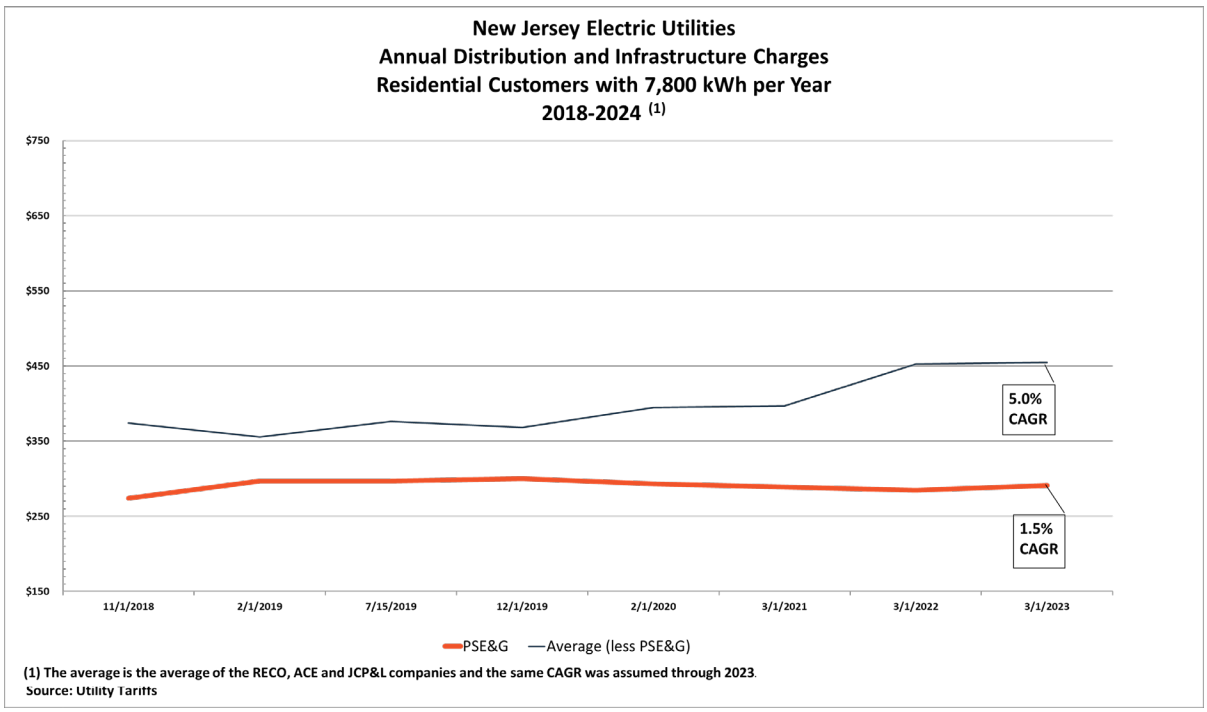

Figure 1

With respect to the Company's electric distribution rates, as can be seen in the chart, applying the State-wide average electric usage of 7,800 kWh per year for a typical residential customer to each utility (even though the average usage for PSE&G's typical residential customer is lower), the distribution portion of the bill for PSE&G, which is the subject of this

proceeding, is approximately $291 per year, the second lowest among the State electric utilities and lower than the $455 per year average of the other NJ electric utilities. Further, the Company's compound annual growth rate ("CAGR") of this cost since our last rate case is 1.5%, less than half of the average increase of other New Jersey utilities of approximately 5.0%.

Q. PSE&G's bills are lower on Distribution Charges, but how does PSE&G compare on a total bill basis?

A. PSE&G continues to be lower than the average compared to its peers. In NJ, PSE&G remains on the lower cost side compared to peers in terms of the total electric bill. As shown in Figure 2 below, PSE&G is almost 15% lower than the average.

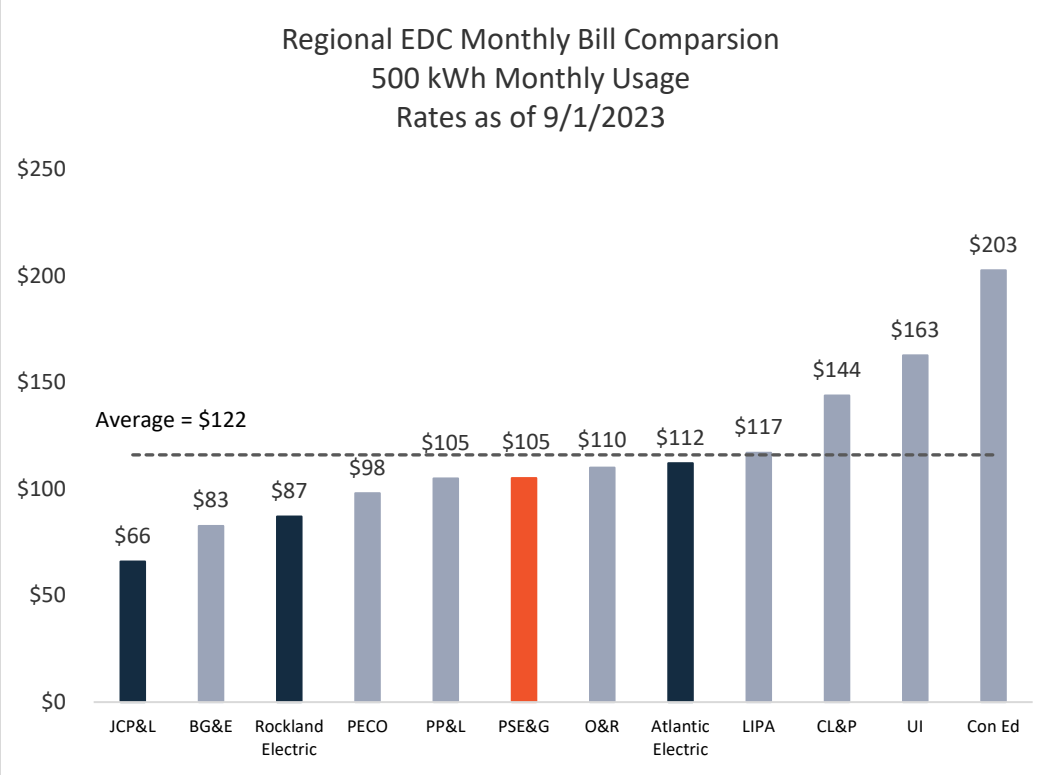

Figure 2

Q. How long has it been since PSE&G's last base rate case?

A. PSE&G filed its last base rate case on January 12, 2018, with new rates effective November 1, 2018. Since that time, every other NJ electric utility has filed at least two base rate cases.

Q. Why has PSE&G not filed a rate case until now?

A. As discussed in more detail below, this is primarily due to the Company's efforts to control costs. PSE&G takes very seriously its responsibility to customers to manage costs prudently and be good stewards of the electric distribution system and the customer funds needed to operate and maintain it effectively. This is achieved by regularly benchmarking Company costs and employee performance and creating appropriate employee incentives to continue to improve upon historic success.

Q. Please describe the efforts the Company has undertaken to protect lower-income customers from the impact of rate increases.

A. The Company is very focused on this vulnerable segment of our customer base. PSE&G's Energy Efficiency programs include incentives targeted to its lower income customers, with specific opportunities for both low and moderate income customers, who often face the highest energy burdens. The Company specifically seeks to provide energy savings opportunities to these customers in order to lower their energy burdens, as participants in the EE programs are expected to benefit from long term energy and bill savings, as well as health and safety improvements. The Company implements the State's Comfort Partners program to customers with incomes up to 250% of the Federal Poverty Level; that program provides free comprehensive energy savings solutions as well as upgrades to address health and safety problems in the home. PSE&G also recently filed its updated Clean Energy Future – Energy Efficiency II Program, which proposes to transfer administration of the Comfort Partners

program to the Company in order further reduce market confusion and streamline the process for lower-income customers to take advantage of energy efficiency programs;[4] PSE&G believes this change in administration of the Comfort Partners program will significantly improve customer access to energy efficiency and allow the Company more flexibility in serving the needs of lower-income customers. Also as part of the Clean Energy Future – Energy Efficiency II Program, PSE&G proposed to continue to target low and moderate income customers by providing comprehensive energy assessments and free direct install of energy efficient measures and services to income qualified households with higher incentives and opportunities for no-interest financing for health and safety improvements to these customers (the Comfort Partners program does not include financing, as all measures are paid for by the program and free to eligible customers), and to continue to provide enhanced opportunities for customers in overburdened communities. PSE&G also offers higher incentives for high efficiency heating and cooling systems and continues to provide financial incentives to both property owners and tenants to install high efficiency equipment in apartments and other multifamily properties. The Company promotes the use of these programs to our customers through bill inserts and community outreach, conducting this communication in multiple languages where possible and appropriate.

Q. Are there other assistance programs for lower-income customers outside of PSE&G's energy efficiency programs, and if so, please describe those programs and who is eligible.

A. The Company also advocates at the State and Federal level for various grants provided to lower-income customers, including the Low-Income Home Energy Assistance Program

[4] *I/M/O The Petition of Public Electric and Gas Company for Approval of its Clean Energy Future-Energy Efficiency II (CEF-EE I) Program on A Regulated Basis*, BPU Docket No. QO23120874 (filed December 1, 2023).

("LIHEAP"), Lifeline and Tenants Lifeline Program ("Lifeline"), and the Universal Service Fund ("USF"). LIHEAP is a Federal Block Grant program that helps low-income individuals and households pay for their winter heating bills, medically necessary cooling benefits, and weatherization. The Lifeline Program helps customers pay their utility bills with a $225 annual utility credit. To be eligible, a customer must be at least age 65, or at least age 18 and collecting Social Security Disability. In addition, a single person must make less than $42,000, or a couple less than $49,000 annually. USF is a statewide program administered by the Department of Community Affairs that allows program recipients to pay no more than 3% of their income for electric and 3% for natural gas, or 6% for total electric, including electric heating for customers at or below 60% of the State median income. PAGE is a program for customers earning up to 500% of the Federal Poverty Limits and offers a grant of up to $700 per utility service. NJ SHARES is for customers earning up to 400% of the Federal Poverty Limit and is funded by customer donations which are matched by PSE&G.

PSE&G has more customers eligible for these low-income programs on a proportionate basis compared with other New Jersey utilities. This customer segment receives special focus.

Q. Are there steps PSE&G has taken during the COVID-19 pandemic to help these customers?

A. Yes. PSE&G, its customers, and New Jersey have faced unprecedented challenges as a result of the COVID-19 global pandemic that created difficult economic circumstances. In response to these challenges, PSE&G developed a comprehensive payment assistance outreach plan utilizing employees and contractors and conducted an external media campaign designed to provide customers opportunities to garner financial assistance and enter into deferred payment arrangements to avoid shut off.

Q. Has the Company considered the impact of electric rates on these customers?

A. Yes. As illustrated in Figure 3 below, the relative cost of PSE&G's services to a typical combined (that is, electric and gas) residential lower-income customer has dropped significantly since 2009 and is essentially flat as compared with rates following the conclusion of the Company's 2018 base rate case.

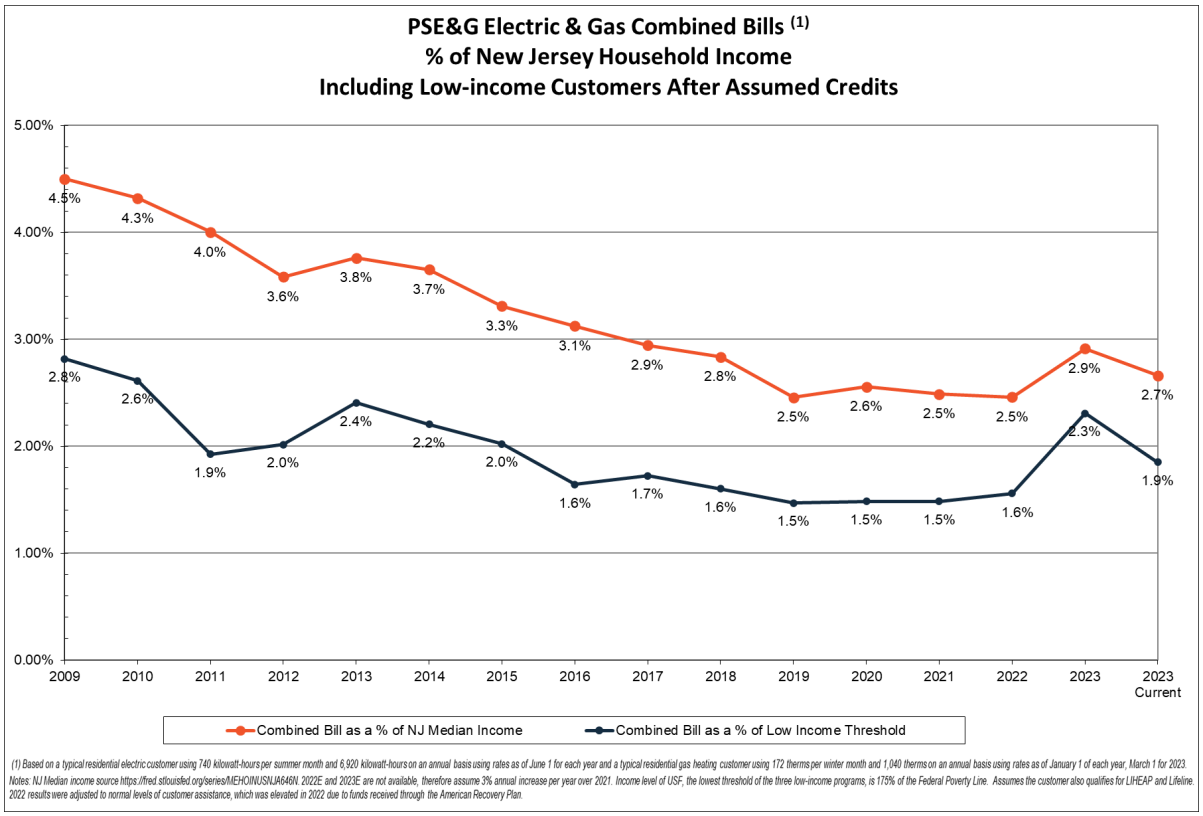

Figure 3

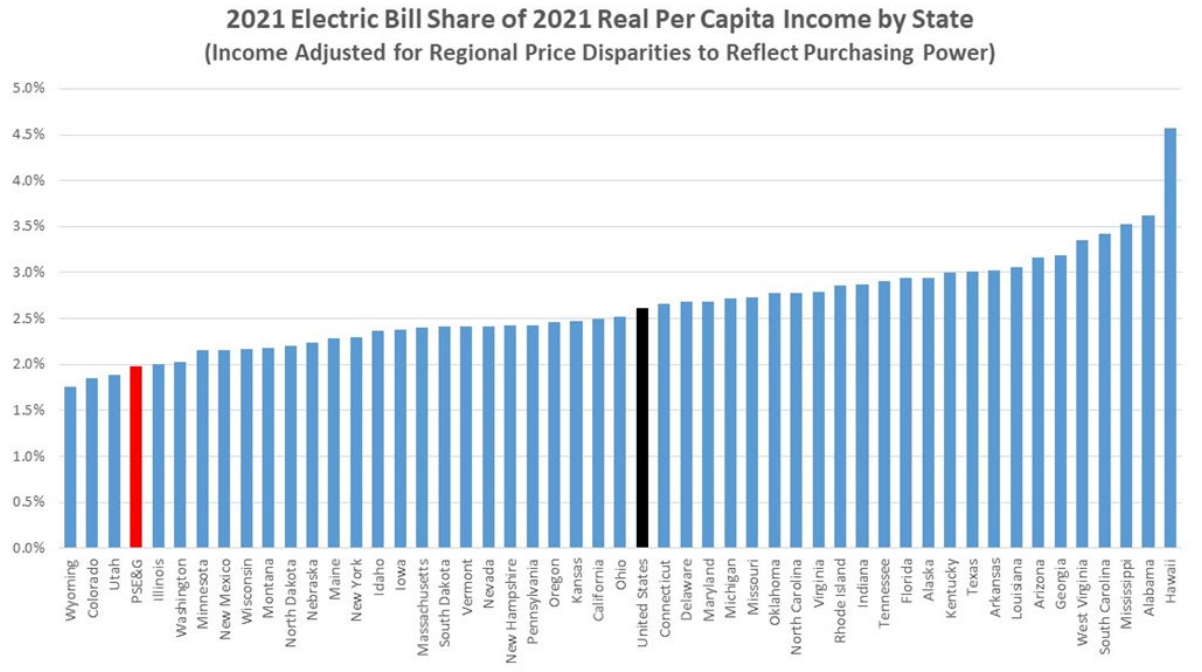
This chart compares the bill as a percentage of income for a typical combined electric and gas residential customer relative to New Jersey's median income and relative to the income threshold below which customers are considered low-income. As can be seen, for the average residential customer, the cost of service is less than 3% of median income. For lower-income customers, the cost of the bill after LIHEAP, USF, and Lifeline grants relative to an income level of 60% of State median income (the level at which a customer is eligible for these grants), is around 2% today. So, even with this proposed rate increase, the cost of electricity and gas

for all of the Company's customers, including low-income customers, remains a very small portion of overall income for those able to take advantage of these programs.

Q. How does this utility bill portion of overall income compare to other states?

A. Very well. As shown in Figure 4 below, PSE&G's residential electric bill as a percentage of per capita income for NJ is in the top quartile compared to the other states in the US. In other words, PSE&G's total bill represents less share of a customer's wallet than the relative utility bill share in most other states.



Source: U.S. Dept. of Commerce, Bureau of Economic Analysis, "Regional Data GDP and Personal Income", June 2023
U.S. Dept. of Energy , Energy Information Agency, "Sales (consumption, revenue, prices & customers", retrieved July 2023.

Figure 4

While PSE&G's bills as a percentage of overall NJ income is very favorable compared to most other states, the Company recognizes the current economic environment and the ongoing need to control costs. PSE&G has and will continue to control costs as much as possible to maintain affordable rates for customers without sacrificing reliability.

Q. How does the current RS Service Charge compare to other utilities?

A. As shown in Figure 5 below, PSE&G's monthly RS electric service charge is the second lowest compared to similar electric utilities in the region.

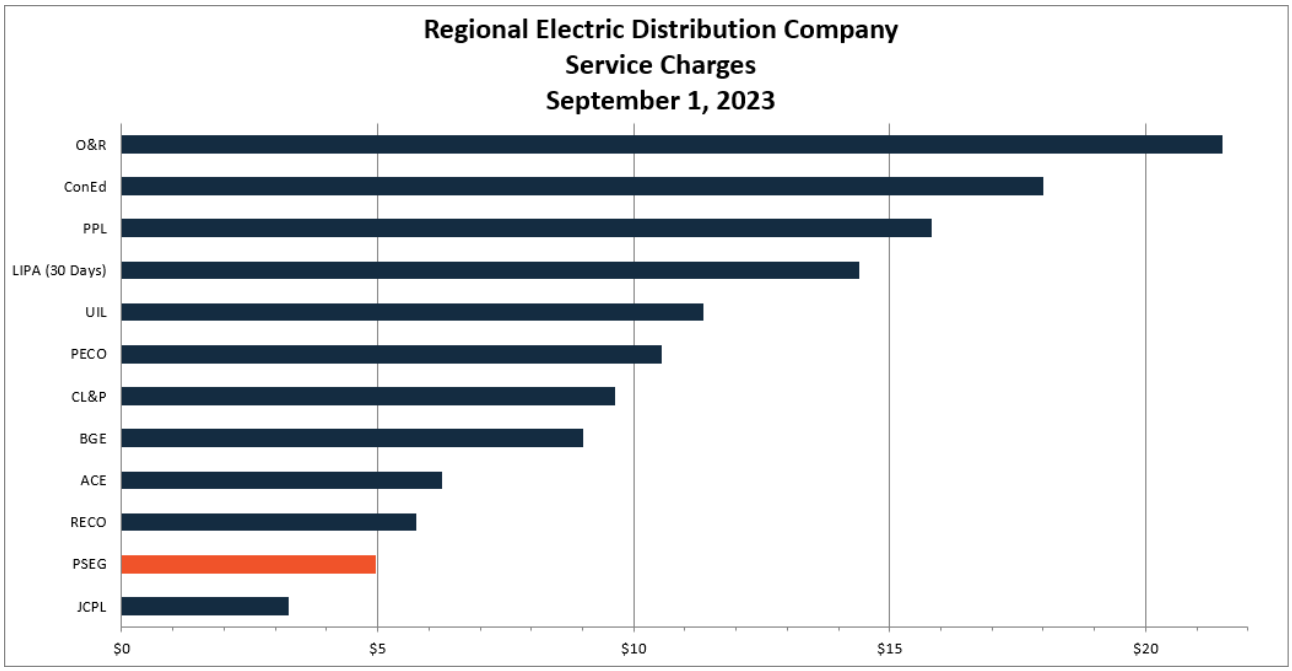


Figure 5

Q. What are the periods used for the COSSs and Rate Design that you are sponsoring in this proceeding?

A. The COSSs presented in this testimony are based upon the period January 1 to December 31, 2022. The only variations from actual costs in the COSS period were the requested overall Rate of Return value, proposed rate base adjustments such as working capital requirements, the proposed *pro forma* adjustments, and adjustments to synchronize the number of customers and usage used in the COSS to those used in the Company's rate design. These adjustments, along with the rate design presented in this testimony, are based upon the Test Year of June 1, 2023 through May 31, 2024 (hereafter "Test Year").

Q. What billing determinants will be used to determine the revenue requirement and rates that are being established in this proceeding?

A. The billing determinants used to establish rates and the revenue requirement allocation for each rate class in this proceeding will be the actual Test Year billing determinants as adjusted for normal weather. For the initial filing and any updates (prior to the final filing) with all actual data, the billing determinants will be a mix of weather normalized actual and forecasted billing determinants. Weather normalized billing determinants are calculated by adjusting actual recorded monthly electric sales to account for the effects of abnormal weather. A summary of the actual billing determinants, the weather normalized billing determinants, and the variation of each determinant from normal for the Test Year period is shown in Schedule SS-E2.

Weather Normalization of Billing Determinants

Q. What weather pattern is used to weather normalize actual billing determinants?

A. The Company utilizes a twenty-year weather pattern as measured at Newark Liberty International Airport covering the period ended December 31, 2021.

Scope of the Cost of Service Study

Q. Please describe the COSSs that the Company is presenting in this proceeding.

A. The Company is presenting two COSSs in this proceeding – its recommended COSS, referred to as the "Company COSS" – and an additional COSS based on a methodology developed by BPU Staff, referred to as the "Staff COSS." As discussed more fully below, the Company does not support the use of the Staff COSS to establish rates in this proceeding, but is submitting the study in compliance with the 2018 Rate Case Order. The COSSs discussed in this testimony are for the electric distribution portion of the Company's operations. Thus, the COSSs are generally "wires only" analyses for the regulated electric delivery business.

They do not include the costs for the Company's Transmission business, which is under the jurisdiction of the Federal Energy Regulatory Commission ("FERC"), nor any electric production or supply costs. Although PSE&G remains responsible to provide BGS, the determination of rates charged to end-use customers for this service are addressed in other proceedings.

Adjustments to Accounting Data

Q. Did you make any adjustments to the accounting data used in the COSSs?

A. Several adjustments to the 2022 accounting data used in the COSSs were necessary prior to its use. These adjustments and the FERC Account associated with each of these adjustments are shown in Schedule SS-E3.

In the rate design process, the unit charges associated with these adjustments will be added back as appropriate in each rate schedule to assure full recovery of all expenses. The Company COSS and the Staff COSS each include these adjustments to costs and billing determinants.

COST OF SERVICE STUDY ("COSS") OVERVIEW

Introduction

Q. What is the first step in developing new electric rates?

A. The first step in developing new electric rates is the preparation of an appropriate COSS. The Company COSS was used to both separate costs by functional segments and to apportion (or allocate) these segmented costs to the rate classes or sub-classes based upon each class's responsibility for that cost.

Q. What is the objective of an COSS?

A. The objective of the COSS is to measure the cost responsibility of each rate/class and distribution function (functionalization).

Cost Allocation Concepts

Q. Please describe the cost allocation concepts used in the Company's COSS.

A. Inherent in any COSS is the allocation to rate classes of many costs which by their nature are difficult to relate precisely to cost causation. Cost causation describes the cause-and-effect relationship between customer requirements, load profiles, and usage characterization, and the costs incurred by the utility to serve those requirements. Experts will differ on the best way in which many costs should be allocated among customer classes. The key is to determine which approach makes the most sense in terms of best answering the question of what caused the cost, and then to apply the result in a reasoned, balanced manner. At all times, it is important to recognize that the COSS is intended to be a guide to appropriate ratemaking, and that one objective of ratemaking is that the end result should be a reasonable one.

The development of a COSS requires an understanding of the operating characteristics of the utility system. Electric distribution company facilities, such as substations, wires, and transformers, are planned and constructed to provide reliable service on a least-cost basis. distribution planners must design distribution systems with sufficient wire and transformation capacity to meet customers' peak loads while, of course, maintaining safety and reliability.

Each portion of the electric distribution system is nominally designed to carry the expected peak electric loads, without concern for the loadings in other hours or periods of the year. Although it is mathematically possible to develop an allocator of costs based upon virtually any attribute or formula, the use of a method that has little or no relation to the underlying cost causation is simply flawed. If the adopted approach reasonably tracks cost causation and the guidance is applied with a reasoned, balanced view, fair and equitable delivery rates to all classes of delivery customers will be the end result.

As I discuss later, I have used the results from the Company COSS as a guide in developing rates, but tempered the final rate design to provide a reasonable balance between the goal of moving each rate schedule towards costs and the goal of holding the increases to reasonable percentage increases based upon the resulting customer impacts.

General Cost Allocation and Functionalization Methodology

Q. What is the basis for the cost allocation and functionalization methodologies used in the Company COSS?

A. The Company COSS incorporates a method identical to that as used by the Company in its prior electric base case and is based on the concepts and theories recommended in Chapter 6 of the current NARUC Electric Utility Cost Allocation Manual ("NARUC Manual") regarding the classification and allocation of electric distribution plant. Although much has changed in the industry since this document was published, the methodology presented is still valid and relevant to evaluating the costs for today's electric distribution business.

The NARUC Manual outlines the general methodology to be used on page 90 as follows:

> *When a utility installs distribution plant to provide service to a customer and to meet the individual customer's peak demands requirements, the utility must classify distribution plant data separately into demand- and customer-related costs.*

And later on that same page 90:

> *Distribution plant Accounts 364 through 370 involve demand and customer costs. The customer component of distribution facilities is that portion of costs which varies with the number of customers. Thus, the number of poles, conductors, transformers, services, and meters are directly related to the number of customer's on the utility's system…each primary plant account can be separately classified into a demand and customer component.*

The NARUC Manual then discusses the allocation of the demand related distribution costs on page 97 in the middle of the first paragraph:

The load diversity at distribution substations and primary feeders is usually high. For this reason, customer-class peaks are normally used for the allocation of these facilities. The facilities nearer the customer, such as secondary feeders and line transformers, have a much lower diversity. They are normally allocated according to the individual customer's maximum demands.

Q. What are the fundamentals of classifying and allocating the costs of providing distribution service that are described in the NARUC Manual?

A. The methodology presented in the NARUC Manual presents three key distribution Cost of Service fundamentals for classifying and allocating costs incurred to provide each customer distribution service:

1. Distribution costs have no energy related component
2. The load diversity as experienced by specific facilities or equipment determines the cost allocation method that should be used
3. Poles, conductors, line transformers, services, and meters have a customer component

Q. Please describe these three fundamentals and how they are used in the Company COSS.

A. The first fundamental, the absence of an energy related component, is very basic. With the limited exception of electrical losses, the amount of energy, as measured by kWh consumption, has no impact on the planning, design or installation of any electric distribution plant. Therefore, kWh consumption has not been included in the Company's methodology as the basis of allocation of distribution costs.

The second fundamental, load diversity as experienced by specific facilities or equipment, is somewhat subtle. Electric distribution facilities are designed based on various criteria depending upon the function of each particular piece of equipment.

On one extreme, a piece of equipment that connects a customer to the electric system (such as a service drop) is sized to handle the expected peak load of that customer, regardless

of when that peak load might occur. For example, for some residential customers this peak might be a hot summer night when they have their central air conditioner at full power, all the lights in the house are turned on, and the refrigerator is running. For other residential customers without many appliances, the peak might occur on Christmas morning when decorations are lit and the furnace fan on the gas heating unit turns on. Similar effects would be seen for all types of industrial and commercial customers as well, with the occurrence of the peak load varying, in effect, by customer.

On the other extreme, an electric distribution substation is designed to handle the peaks expected at that specific substation at the time of peak demand at that location. At these locations, a customer's peak demand, the number of customers served, or even kWh usage for any specific customer or any combination of customers, is immaterial. The only value that matters is the expected peak demand at that substation. For the Company's service territory, given the combined loads of customers, equipment installed, and the local climate, these peaks are customarily observed in the late afternoon of a hot summer day.

The effect of varying diversity is a continuum between these two extreme points of the electric distribution system. To determine the effects of such variations in load diversity between the substation and the service drop, or to develop a unique cost allocation methodology to account for each different type of diversity of load, would be a vast and impracticable task. In practice, any methodology used must strike a balance between one that is both theoretically ideal and one that can actually be implemented. The methodology presented in this testimony strikes this balance and is consistent with the underlying basis for the installation and design of the distribution system by the Company's distribution planners.

Q. Does the Company agree with the third fundamental identified by NARUC -- that certain facilities such as poles, conductors, line transformers, services, and meters have a customer component?

A. Yes. The Company agrees with the third key point identified in the NARUC Manual, that a portion of distribution facilities are customer related. However, due to the complexities and resources required to perform a study of the portion of facilities that should be classified as customer related, and the likelihood that such a study would show a need for increased residential charges that would far exceed what the Company is proposing in this proceeding, the Company has not undertaken a study to quantify this customer-related portion for this proceeding, but may do so in future rate cases.

Q. How is the PSE&G electric distribution system segmented or functionalized in the Company COSS?

A. As explained in more detail below, the Company COSS segments the electric distribution utility plant into six distinct segments – Access, Local Delivery, System Delivery, Street Lighting, Customer Service, and Measurement. Of these six segments, the Access, Local Delivery, and System Delivery segments are much larger than the other three and form the core of the distribution business.

Q. Please describe the Access, Local Delivery, and System Delivery segments in more detail and provide an overview of how you have allocated the costs of these segments.

A. The Access segment is limited to the electric service drop to individual customers; the Local Delivery segment is comprised of plant that is shared among a small number of customers, and the assets comprising the System Delivery segment serve a large number of customers. Consistent with the second and third NARUC fundamentals discussed above, I have allocated the Local Delivery costs based on the sum of customer individual peak

demands. This allocation follows the NARUC cost causation principle that facilities that are electrically close to customers are sized to carry the sum of undiversified customer peak loads.

Because System Delivery facilities are electrically farther from the customers, and see only highly diversified customer demands, I have allocated these facilities' costs solely on the basis of each rate class's contribution to the system peak, or what is termed each rate class's Coincident Peak ("CP"). The sum of customer peaks for Local Delivery costs and rate class CPs for System Delivery costs forms a reasonable basis for the allocation of costs to each rate class because they represent the underlying basis of the cost causation for the type of equipment that comprises each distinct segment.

Because subtransmission and primary circuits have characteristics partially consistent with Local Delivery and partially consistent with System Delivery assets, a cost separation methodology for allocating these costs was developed in consultation with the Company's distribution planners. For subtransmission circuits, the function of which is primarily to distribute power between substations and only secondarily to serve 26 kV customers (on Rate Schedule HTS-subtransmission), an analysis of the loads determined that a 21.1% - 78.9% spilt between the functions of Local Delivery and System Delivery was appropriate.

The function of primary circuits, however, was determined to be more evenly split between providing Local Delivery and System Delivery functions. A primary circuit carries power from a substation to customers who are typically served through transformers along its length. The portion nearest the substation connection has a highly diversified load because it carries the load attributed to all customers on that particular circuit. It thus performs a function similar to that of the substation, and thus could be considered primarily a System Delivery asset and should be largely allocated on the CP of the classes served. On the other extreme, the portion of the circuit that is electrically farthest away from the substation may serve only

one customer and must be designed to handle the peak demand of that specific customer, resulting in zero load diversity. It thus could be considered a Local Delivery asset and allocated on the sum of the customer peaks for the classes served. Along the length of the primary circuit, the diversity gradually shifts from the highly diversified load at one end to the undiversified load at the other end. As a result, I have utilized a 50% - 50% split between Local Delivery and System Delivery to segment and allocate all primary circuits' costs as a representation of the average diversity and dual functionality of this equipment.

The remaining segment, the Access segment, is allocated via a special study of the costs of service drops by rate class as discussed more fully below.

Functionalization of the Six Segments

Q. What is the first step in the process of performing an COSS?

A. As the first step in that process, the COSS unbundles total costs into the six distinct functional segments that I previously discussed – Access, Local Delivery, System Delivery, Street Lighting, Customer Service, and Measurement.

Q. Once these functional segments are developed, how are they used?

A. These separate functions (or segments) assist in the development of individual rate schedule components, such as the Service Charge. Once the plant and expenses are functionalized to the proper segment, the allocation process spreads the cost responsibility to the rate classes.

Q. What items are included in each of these segments?

A. The list below describes what is included in each of the six segments:

- The Access segment includes the plant and operation and maintenance ("O&M") costs related to the electric service drop.

- The Local Delivery segment includes all equipment (plant and O&M) related to the local distribution facilities.
- The System Delivery segment includes all equipment (plant and O&M) related to the "bulk" system distribution facilities.
- The Street Lighting segment is limited to the luminaires, brackets, and poles used only for street lighting purposes (the latter termed "street lighting poles").
- The Customer Service segment includes all costs relating to billing, inquiry, sales, service, and collection activity.
- The Measurement segment includes the costs for meter reading, meter plant, and meter O&M.

Q. Are all costs included in these six segments?

A. Yes, all costs are functionalized to one or more of these of six segments.

Access Segment

Q. Please discuss the Access segment in greater detail.

A. The Access segment is the initial link between the shared or common distribution system and the customer's own electric system, comprised of the electric service drop whose gross plant is recorded in FERC Account E369. Service drops are illustrated as a thick dashed line on Schedule SS-E4. The embedded costs for this segment are allocated across the rate classes based on an analysis of current unit costs, determined from typical service drop lengths and wire types as estimated by the Company's distribution planners. In situations where various size services are used to provide service to customers on the same rate schedule but with different peak loads, only the relative cost of the minimum size service is functionalized to this segment. The remainder is functionalized to the Local Delivery Segment for recovery

through kWh or kilowatt ("kW") charges and is not included in the costs to be recovered by Service Charges.

Local Delivery Segment

Q. Please discuss the Local Delivery segment in greater detail.

A. As discussed above, the Local Delivery facilities are the portions of the distribution system that are used to serve multiple customers and are also electrically and physically closest to the point of connection with individual customers' service drops. These facilities include the following types of plant:

- All secondary wire other than that used for customer service drops and for street lighting service,
- All line transformers; including all pole top units, pad mounts, underground, and network transformers,
- 21.1% of the Company's 26 Kilovolt ("kV") circuits - including poles, conductors and devices (only applicable to customers served at subtransmission voltages),
- 50% of the Company's primary circuits - including poles, conductors, and devices, and
- The portion of the service drop and meters in excess of the relative minimum amounts.

Although many customers share these facilities, the load carrying capacity of individual transformers, lines, and circuits is driven primarily by the sum of the undiversified peak demand of individual customers. Therefore, the majority of investment in the Local Delivery segment has been allocated to the rates based on the sum of the customers' individual peak demands.

As I have previously mentioned, although the Company agrees with NARUC that a portion of these facilities is customer-related and should be allocated based on the number of customers served, it is not proposing an allocation method based on this fundamental in this proceeding but may do so in future rate case proceedings. The outcome of such an allocation study would likely indicate that residential customers cause a higher proportion of costs than indicated by the methods used in preparing the Company COSS.

Investment in line transformers was allocated to the rate classes based on the average embedded costs, on a dollar per kVA basis, that were derived from a study that linked the actual transformer serving each customer with the Company's accounting records. This study is provided in the workpapers that support this testimony**.** Facilities related to the Local Delivery segment are illustrated as a thin solid line on Schedule SS-E4. A detailed discussion of the segmentation and allocation of each FERC Plant Account related to this segment is discussed in Appendix-E1.

System Delivery Segment

Q. Please discuss the System Delivery segment in greater detail.

A. The System Delivery segment is used for the portions of the distribution system that are planned to meet large, very diversified loads from many sizes, classes, and types of customers. Thus, this segment is composed of the portion of the distribution system facilities that is electrically farthest from individual customers and is sometimes referred to as the bulk distribution system. It is comprised of the following type of facilities:

- Switching stations and substations (the distribution portions only),
- 78.9% of the Company's 26 kV circuits - including poles, conductors, and devices, and

- 50% of the Company's primary circuits - including poles, conductors, and devices.

The costs for these System Delivery facilities are allocated across applicable rate classes based on the classes' contribution to the system CP, because the CP criteria is used as the planning criteria for this type of investment. Facilities relating to the System Delivery segment are illustrated as a thick solid line on Schedule SS-E4. As with the prior segment, a detailed plant-by-plant discussion of the segmentation and allocation is discussed in Appendix-E1.

Street Lighting Segment

Q. Please discuss the Street Lighting segment in greater detail.

A. This segment comprises the investment for street lighting luminaires, street lighting poles (poles used exclusively for street lighting), and other miscellaneous devices such as street lighting brackets and/or shrouds, and all associated O&M expenses for this equipment. Where a pole is used solely to provide street lighting, termed a "street lighting pole," one section of secondary wire was also segmented to this function for each pole so identified.

All investment and expenses in the Street Lighting segment were directly assigned to the three street lighting Rate Schedules of BPL, BPL-POF, and PSAL based upon the number and type of lights and poles billed under each rate schedule.

Customer Service Segment

Q. Please discuss the Customer Service segment in greater detail.

A. This segment encompasses all costs related to Customer Service type functions, such as costs related to billing, payment receipt and processing, collection activity, and other account maintenance type costs, with the exception of meter reading costs, which are included

in the Measurement segment. These costs are allocated to the rate classes based upon a separate study of Customer Service functions.

Measurement Segment

Q. Please discuss the Measurement segment in greater detail.

A. This segment includes costs for meter reading and the investment and O&M related to the meters themselves. Meter reading costs are allocated to the rate classes based upon a separate embedded cost analysis of Customer Service functions. Given that new Advanced Metering Infrastructure ("AMI") meters are relatively the same cost for customers in each rate class, the meter investment is allocated across the rates based upon the relative installed cost of new meters.

Modeling Procedures

Q. Please describe the COSS modeling procedures as well as how all COSS items are segmented and functionalized.

A. The COSS was developed based upon the weather normalized billing determinants and costs for each of the rate schedules for the COSS test period as defined above. The revenues received by each rate class were calculated (or target balanced) such that the resulting Rate of Return ("ROR") for each rate class equals the Company's proposed overall ROR. Schedule SS-E5 contains the complete details of these final COSS model results, Schedule SS-E6 presents a summary report of the revenue requirements by functional segment, while Schedule SS-E7 shows the revenue requirements by function (or segment) for each rate class.

The detailed description of how all COSS items are modeled, segmented, and functionalized is discussed in Appendix-E1. In Appendix-E1, a description is provided of how each of the major plant categories (gross plant) is segmented or functionalized. I then discuss the procedures used for Common and General plant, depreciation reserve, adjustments to rate

base, operating revenues, O&M expenses for utility plant, A&G expenses, depreciation and amortization expenses, pro forma expense adjustments, and finally, taxes.

Schedule SS-E5 shows the details of the COSS used to calculate distribution revenue requirements by rate schedule. This study was used in the development of the proposed rates. These results are summarized by revenue requirements for each rate schedule and by segment in Schedule SS-E6.

Q. Please summarize the results of the Company COSS.

A. Schedule SS-E5 shows the details of how each plant and expense item was separated into each of the six segments and allocated to each category of customers for each of the various rate classifications based upon the extent to which those groups of customers caused the costs, along with the results of the allocation for each plant and expense item. Schedule SS-E6 shows a high-level summary of expenses, plant, and revenue requirements for each of the six functional segments, while Schedule SS-E7 is a summary report of the rate related revenue requirement for each rate class in total.

The revenue requirements reported in Schedules SS-E5, SS-E6 and SS-E7 do not include the costs or revenue requirements associated with adjustment clauses and New Jersey Sales and Use Tax ("SUT"). These costs, however, will be collected from customers directly through the appropriate charges, as I will discuss in the Rate Design portion of this testimony.

Synchronizing the Cost of Service Study to the Rate Design

Q. Please explain how the Company COSS was synchronized with the proposed rate design.

A. As previously noted, the Company COSS is based on the period of January 1, 2022 through December 31, 2022, while the rate design is based on the Test Year of June 1, 2023 through May 31, 2024. It is not possible to use the COSS results directly in the rate design

process because the number of customers, kilowatt-hours delivered, as well as plant and expenses are slightly different between these two time periods. To properly execute the rate design process, the Company COSS results must be adjusted slightly to correspond to the rate design test year period. The methodology used to synchronize the COSS results is included in Schedule SS-E8. Because the primary difference is in the number of customers and amount of energy delivered, each functional segment's revenue requirement from Schedule SS-E7 was multiplied by the ratio of either the number of customers or kilowatt-hours delivered for the rate design test year to the value during the COSS year. The development of these sync factors is shown on page 1 of Schedule SS-E8. The revenue requirements associated with the Street Lighting Segment (Col 1), Local Delivery Segment (Col 3), and the System Delivery Segment (Col 4) were adjusted by the ratio of the kWh delivered in these two periods. The revenue requirements associated with the Access Segment (Col 2), Customer Service Segment (Col 5) and the Measurement Segment (Col 6) were adjusted by the ratio of the number of customers in these two periods, except for rate classes BPL, BPL-POF, and PSAL, which were adjusted by the kWh sync factor described above for all functional segments. These steps are shown on lines 1 to 15 of page 2 of Schedule SS-E8. The resulting adjusted COSS functionalized revenue requirements are each then adjusted on an equal percentage basis so that the total equals the proposed revenue requirements, as set forth on lines 21 to 35 of page 2 of Schedule SS-E8. It is these final adjusted functionalized revenue requirements that are used in the rate design process.

RATE DESIGN

Introduction

Q. What are your objectives for developing proposed electric rates?

A. The proposed electric rates have been developed to meet several objectives. The primary purpose is to provide recovery of revenues equal to the amount of the proposed revenue requirement. Additionally, this recovery should be effectuated on an equitable basis that provides correct price signals to individual customers based on the cost to serve those customers. The final objective is that rates should be simple and understandable for the customer.

Q. Why is it important to send correct price signals to individual customers based upon the cost to serve those customers?

A. I cannot overemphasize the need for development and implementation of correct price signals to customers. Distribution pricing must follow the underlying demand-based cost causation. Rates designed following this methodology will be equitable and will provide the ability for appropriate demand response from customers who are able to change usage patterns to achieve economic savings as a result of the price signals provided.

Q. What determines the cost to serve customers?

A. The Company COSS presents an allocation among customer groups of the embedded costs to provide regulated utility services and determines the cost to serve customers.

Q. Are the proposed new rates based solely on the results of the Company COSS?

A. No. The COSS is a guide to appropriate ratemaking; its results are not applied in a strict mathematical manner to design proposed rates. While the goal is to move rates toward a full cost basis, the achievement of that goal must be balanced against the need to achieve reasonable end results as I discuss more fully below.

Q. Do the rates included in your testimony include or exclude New Jersey SUT?

A. The proposed rates discussed in the next sections of my testimony and associated Schedules exclude SUT unless specifically indicated. However, the appropriate prices both without and with SUT are included in the Proof of Revenue by Rate Schedule in Schedule SS-E11 as well as the proposed Tariff Sheets set forth in Schedule 1 of the transmittal letter, and all other schedules that reference rates charged to customers.

Limitations on Rate Changes

Q. Did you apply limits in designing proposed rates in this proceeding, and, if so, why?

A. Yes. To achieve an overall goal of designing just and reasonable rates, I applied the principle of "gradualism" to temper the rate increases indicated by the results of the Company COSS. To apply the principle of gradualism, I employed a number of limits on the size of the rate increases that are proposed.

Q. Please describe the rate increase limits used in developing the proposed electric rates.

A. The first limit is that the proposed overall percentage revenue increase will be shared among all customer classes. Although a primary goal is to move the distribution rates for each rate class toward costs as indicated by the Company COSS, no class will receive less than 50%, nor more than 125% of the overall average distribution percentage increase. In addition, no class will receive more than 150% of the overall average percentage bill increase. These rate increase limits were selected to provide a reasonable balance between the goal of moving towards costs, and the need to achieve equity among customers. The calculation and percentage values of these limits are shown on page 1 of Schedule SS-E9.

Q. Are there any exceptions to the proposed limits?

A. Yes. Much of the revenue requirement increase has been driven by grid investments that are unrelated to BPL and PSAL luminaries and poles. BPL luminaires and poles current distribution revenue is nearly at its cost to serve, therefore the proposed minimum distribution revenue percentage increase was lowered from 19.742% to 10%. The proposed distribution revenue percentage increase for PSAL luminaires is 20.607%, which increases its revenue almost equal to its cost to serve.

Inter Class Revenue Increase Allocations

Q. Please describe the process for allocating the proposed distribution increase to each rate class.

A. Page 1 of Schedule SS-E9 shows the calculation of the overall average percentage increase for distribution and total electric bills, as well as the calculation of the upper and lower limits to be used in the inter class revenue increase allocation on Schedule SS-E9, page 2.

Page 2 of Schedule SS-E9 shows the proposed inter-class allocation of the revenue increase. The Rate Schedules are indicated in Column 1, while Column 2 is the Proposed Distribution Revenue Requirement based upon the Company COSS results that were synchronized to the rate design test year. Column 3 is the Present Distribution Revenue, while Column 4 shows the increase that would occur if the synchronized Company COSS results were used directly – hence the use of the word "Unlimited" in the column heading. Column 5 is the present total electric bill calculated as if all customers were supplied at BGS rates. Column 6 is the percentage increase in distribution if the unlimited increase in dollars (from Column 4) were applied to the rates; that is, the percentage increase to each rate schedule if these COSS based increases were applied without constraints. The result of the proposed allocation of the Company's revenue requirement increase to the rate classes, consistent with

the principles outlined in the previous section, Limitations on Rate Changes, is presented in Column 7 and Column 9. Specifically, Column 7 shows the percentage increase and Column 9 shows the Proposed Distribution Revenue Increase by Rate Class. Column 8 shows the proposed total bill percentage increase if all customers were supplied at BGS rates.

The final step was to calculate the proposed distribution revenue increases for all rates other than Rate Schedules BPL and PSAL. These calculations and the application of the limits were performed in an Excel spreadsheet utilizing the "Goal Seek" function to both meet all of the requirements of the limits and properly allocate any revenue shortfall between the rates, while recovering the full requested increase in distribution revenue.

Page 3 of Schedule SS-E9 continues the proposed inter-class allocation from page 2. Column 2 carries over the Proposed Distribution Revenue Increase from Column 9 of page 2 and adds on the revenue impacts of TAC (from Column 3) and the proposed DAC (from Column 4). Column 5 shows the resulting net distribution revenue increase including TAC and DAC, while Column 6 shows the proposed total bill percentage increase if all customers were supplied at BGS rates.

Q. How should the rate design be affected if the Board approves an amount other than the Company's overall revenue increase request?

A. If the Board approves an amount other than the Company's overall revenue increase request, the increase to each of the classes should be allocated in proportion to the proposed distribution revenue increase shown in Column 9 of Schedule SS-E9, page 2.

General Rate Design Principles and Methodology

Q. Please describe the general rate design principles and methodology used in developing the proposed electric rates.

A. The rate design methodology presented in this testimony follows the philosophy of the cost allocation methodology used in the Company COSS in order to align, as closely as

practicable, the rates (prices charged to customers) with the underlying costs of serving those customers. This is a key element in the Company's rate design and its importance cannot be overstated. The rate design process is not just to recover the proper amount of revenue from each class, but, to the extent practicable, from individual customers as well, thereby preventing the subsidization of one customer by another. An appropriate rate design will provide correct price signals that reflect how customers' individual facilities impact the costs of the electric distribution system. Only by giving due recognition to what it costs to serve customers can the customers make the correct economic decisions.

The Service Charges for all rates that have service charges were set to move towards the sum of the revenue requirements indicated in the Company COSS for the Customer Service, Measurement and Access segments. With the exception of Rate Schedule RS and RHS, the change in these Service Charges were limited to the same general inter rate class limits of no more than 150% of the overall average distribution percentage increase. The proposed Service Charge change for Rate Schedules RS and RHS will be discussed later in my testimony.

These limits were selected to provide a reasonable balance between the goal of moving each rate component toward costs, and the goal of avoiding unreasonable bill impacts. Any shortfall in Service Charge revenue resulting from these limits was transferred to the remaining Local Delivery based charges of the particular rate schedule. These calculations are as shown in Schedule SS-E10.

The Distribution Charges for each rate class were set, subject to the limits on the percentage change previously discussed, to recover all the revenue requirements of the Local and System Delivery segments plus any shortfall created from limitations on the proposed Service Charges. The specific unit rate charges (the per kWh or per kW charge) in each rate

class are designed to recover the revenue requirements of the Local Delivery segment from annual billing determinants, while the revenue requirements for System Delivery are designed to be recovered only through summer billing determinants. Because the Company's system peak has consistently occurred during the summer period, the summer kWh is the best billing determinant to send the price signal to the customer that is most closely aligned with cost causation. For example, for a rate designed only around non-blocked kWh charges, such as Rate Schedule HS, the winter charge per kWh is the Local Delivery segment revenue requirement divided by the annual kWh use (the annual billing determinant). The summer charge per kWh is the System Delivery segment revenue requirement divided by the summer kWh use (the summer billing determinant), plus the Local Delivery segment revenue requirement divided by the annual kWh use (the annual billing determinant).

For the demand Rate Schedules GLP, LPL and HTS, the Company is proposing to continue two separate demand charges as currently applied. The first, the Annual Demand Charge, is a charge per kW for the monthly maximum kW that will be applicable in every month and is based on each rate class's portion of the Local Delivery segment costs divided by the sum of the customers' monthly peak demands. For Rate Schedule GLP, these applicable demands are the customer's monthly measured peak demands over the entire year. For Rate Schedule LPL-Secondary ("LPL-S") and LPL-Primary ("LPL-P"), these applicable demands are the customer's monthly measured peak demands occurring during any time period over the entire year. For Rate Schedule HTS-Subtransmission ("HTS-S") and HTS-High Voltage ("HTS-HV"), the applicable demands are the customers' single highest demand that occurs at any time during the entire year, also referred to as a "ratcheted demand."

The second demand charge, the Summer Demand Charge, is a charge per kW of the monthly peak demand but is only applicable in the four summer billing months – June through

September. This charge is based on each rate schedule's share of the System Delivery segment cost divided by the appropriate kW peak demands for the summer period only. For Rate Schedule GLP, these applicable demands are the customers' monthly peak demands for the summer billing months only (June to September billing months). For Rate Schedules LPL-S, LPL-P, and HTS-S, these applicable demands are the customers' monthly peak demands occurring during the on-peak periods in the four summer billing months.

The recovery of distribution revenue requirements through demand charges for those rate classes that are assessed demand charges is consistent with the Company's historical and current rate structure. Put into the context of the total electric bill for the average customer based upon annualized weather normalized rates, the portion of revenue that is collected through distribution demand charges remains small and ranges from approximately 17% for Rate Schedule GLP to 5% for Rate Schedule HTS-HV.

The limits for the changes in charges for individual luminaires and poles under Rate Schedules BPL, BPL-POF and PSAL will be discussed later in the discussion on the specific changes made to these Rate Schedules.

RATE SCHEDULE SPECIFIC CHANGES

Rate Schedule Residential Service ("RS")

Q. Please describe the rate design for Rate Schedule RS.

A. The rate design for Rate Schedule RS is shown starting on page 4 of Schedule SS-E11. The current rate is comprised of a monthly Service Charge, plus distribution charges based on monthly kWh use, with the charges differentiated using a two-block rate structure in the summer period.

As indicated in Schedule SS-E10 - Service Charge Calculations, (line 2), the Company COSS indicates that a significant increase in the monthly Service Charge is warranted. Consistent with the principle of cost causation, balanced by the principle of gradualism, the Company proposes that the Service Charge be increased by 1.5 times the average distribution increase to move the service charge closer to actual cost. The present kWh charges are blocked at 600 kWh per month. The winter rates are identical for both blocks, whereas the summer rates have an inclining block rate, where the second block (for usage greater than 600 kWh per month) is $0.003821 per kWh greater than the rate for the first block.

As previously described, the Company COSS results indicate that the summer charges should be greater than the winter charges because System Delivery revenue requirements should be recovered through summer kWh charges and Local Delivery revenue requirements should be recovered over the entire year. In the Company's previous base rate case, the summer kWh charges were set at an inclining block rate structure whereby the second block was $0.003821 per kWh (without SUT) higher than the first block. There is no underlying cost basis for an inclining block rate structure for the recovery of distribution costs. In fact, analysis based on load profile data shows that higher use customers have a higher load factor which would support a lower per kWh charge for the second block or a "declining block" rate structure. Despite the evidence that supports a declining block rate structure, consistent with the principle of gradualism, the Company proposes to keep the first and second blocks the same and not request a declining block rate structure.

Even with the proposed revenue increase, the proposed RS rate class revenue is significantly below cost. In addition, the current Summer Distribution kWh Charge is significantly lower than the cost to serve while the Winter Distribution kWh Charge is somewhat higher than the cost to serve. Therefore, the Company is proposing to adjust both

summer and winter Distribution kWh rates, so that each kWh rate will be an equivalent percentage below cost. As a result, the remaining distribution revenue increase for RS from page 2 of Schedule SS-E9, less the Service Charge revenue increase, will be recovered through the Summer Distribution kWh Charge.

The results of the Rate Schedule RS rate design appear on page 5 of the Proof of Revenue in Schedule SS-E11. The general format of the calculations is described on the first page of that Schedule. The calculation of the annual electric supply cost utilized in the Proof of Revenue for this and all other rate schedules is based upon all customers purchasing electricity on the appropriate BGS service. The magnitude of the BGS values remain constant in both sides in the Proof of Revenue (Schedule SS-E11) and their inclusion allows the proposed rate changes to be viewed in the context of a customer's overall bill.

Typical Rate Schedule RS customer bill impacts resulting from these changes are shown on pages 1-3 of Schedule SS-E12.

Rate Schedule Residential Heating Service ("RHS")

Q. Please describe the rate design for Rate Schedule RHS.

A. The rate design for Rate Schedule RHS is shown starting on page 6 of Schedule SS-E11. In general, the structure of Distribution Charges for customers on RHS remains the same as it is currently. The rate is comprised of a monthly Service Charge, plus distribution charges based on monthly kWh use, with the charges continuing to be differentiated using a two-block configuration in the summer and winter periods. This Rate Schedule remains closed, grandfathered to specific customers as it has been since January 1993.

As indicated on Schedule SS-E10 Service Charge Calculations, (line 3), the direct use of the Company COSS revenue requirements would indicate that a significant increase in the monthly Service Charge is warranted. In the past, the Service Charge for Rate Schedule RHS

has been set equal to the Service Charge for Rate Schedule RS. Consistent with the principle of cost causation, the Company proposes to maintain this relationship such that the Service Charge would be increased by an amount equal to the treatment proposed in the Rate Schedule RS Service Class

The kilowatt-hour charges are presently blocked at 600 kWh per month, with a declining rate structure block in the winter and an inclining block rate structure in the summer. The Proposed Distribution Revenue for RHS from page 2 of Schedule SS-E9 less the Service Charge revenue was designed to be recovered through the Distribution kWh charges. This remaining balance of revenue requirement was apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS. The Local Delivery portion of the remaining balance of revenue was divided by the sum of the total annual kWh for all usage. The proposed Winter Distribution Charges were designed to maintain the current declining block differential of ($0.017600). The Summer Distribution Charges were designed to recover both the System Delivery portion of the remaining balance of revenue and the summer portion of the Local Delivery revenue. The Company is proposing to set identical rates for both summer blocks, thus eliminating the inclining block rate structure. As is the case with the RS rate class, there is no underlying cost basis for an inclining block rate structure for the recovery of summer distribution costs. In fact, an analysis based on load profile data shows that higher use customers also have a higher load factor based on their individual customer peaks, which would support a declining block rate structure for higher use customers. Consistent with the principle of gradualism, the Company proposes to keep the first and second blocks the same.

Typical Rate Schedule RHS customer bill impacts as a result of these changes are shown on page 4 of Schedule SS-E12.

Rate Schedule Residential Load Management Service ("RLM")

Q. Please describe the rate design for Rate Schedule RLM.

A. The Company is proposing to close Rate Schedule RLM to new customers when the proposed Residential TOU Pilot Program becomes available to customers. The current rate design for the Rate Schedule RLM is shown starting on page 8 of Schedule SS-E11. The structure of distribution charges for customers on Rate Schedule RLM remains similar to what it is currently. The rate is comprised of a monthly Service Charge, plus time differentiated charges based solely on total monthly kWh use in each of two time periods. The Company COSS indicated that a small decrease in the Service Charge was warranted for this Rate Schedule. Applying the limits I discussed previously, the Company is proposing to maintain the current Service Charge.

The Proposed Distribution Revenue for Rate Schedule RLM from page 2 of Schedule SS-E9 less the Service Charge revenue was designed to be recovered through the Distribution kWh charges. This remaining balance was apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS. The Local Delivery portion of the remaining balance was divided by the sum of the total annual kWh for all usage. The System Delivery portion is proposed to be recovered during the Summer On-Peak period only, consistent with the methodology detailed earlier.

Typical Rate Schedule RLM customer bill impacts as a result of these changes are shown on page 6 of Schedule SS-E12.

Rate Schedule Water Heating Service ("WH")

Q. Please describe the rate design for Rate Schedule WH.

A. The rate design for Rate Schedule WH is shown starting on page 10 of Schedule SS-E11. This Rate Schedule also remains closed and is grandfathered to specific premises, as it has been since October 1980.

There currently is no Service Charge for service under this rate schedule and none is proposed. The unit charge has been set equal to the Proposed Distribution Revenue for Rate Schedule WH from page 2 of Schedule SS-E9 divided by the total billed kWh.

Rate Schedule Water Heating Storage Service ("WHS")

Q. Please describe the rate design for Rate Schedule WHS.

A. The rate design for Rate Schedule WHS is shown starting on page 12 of Schedule SS-E11. The Company is proposing no change in the structure of Distribution Charges for this Rate Schedule. The rate comprises a monthly Service Charge plus non-differentiated distribution charges based solely on monthly kWh use.

As indicated in Schedule SS-E10 Service Charge Calculations, (line 6), the Company COSS indicates that a significant increase in the monthly Service Charge is warranted. The Company, however, proposes that the Service Charge should only be increased consistent with the limits discussed previously. The charge was not moved closer to actual costs in order to minimize the percentage increase in the total bill for customers with very small usage.

The Proposed Distribution Revenue for Rate Schedule WHS from page 2 of Schedule SS-E9, less the Service Charge revenue, was designed to be recovered through the Distribution kWh charges.

Rate Schedule Building Heating Service ("HS")

Q. Please describe the rate design for Rate Schedule HS.

A. The rate design for Rate Schedule HS is shown starting on page 14 of Schedule SS-E11. This Rate Schedule is presently closed and is grandfathered to premises receiving service as of August 1, 2003.

As indicated in Schedule SS-E10 Service Charge Calculations, (line 7), the Company COSS indicates that an increase in the monthly Service Charge is warranted. The Company proposes however that the Service Charge should only be increased consistent with the limits previously discussed. The charge was not moved closer to actual costs in order to minimize the percentage increase in the total bill for customers with very small usage.

The summer/winter price differential follows the kWh-only rate price philosophy as previously discussed. The Proposed Distribution Revenue for Rate Schedule HS from page 2 of Schedule SS-E9, less the Service Charge revenue, was designed to be recovered through the Distribution kWh charges. This remaining balance was apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS. The Local Delivery portion of the remaining balance was divided by the sum of the total annual kWh for all usage. The System Delivery portion is recovered through the summer period Distribution kWh charges only.

Rate Schedule General Lighting And Power Service ("GLP")

Q. Please describe the rate design for Rate Schedule GLP.

A. The rate design for Rate Schedule GLP is shown starting on page 16 of Schedule SS-E11. The Service Charge has generally been set based on the per customer revenue requirements for the Access, Customer Service and Measurement segments and increased in accordance with the limits previously discussed. The Service Charge for unmetered accounts

was set based on the per customer revenue requirements for the Access and Customer Service segments because this sub-class has no meters or meter reading expenses. The Service Charge for Rate Schedule GLP-Night Use was set equal to the standard GLP Service Charge. Previously, the GLP Night Use Service Charge was set equal to the Rate Schedule LPL-Secondary Service Charge because previous generation interval meters were required. With the implementation of the advanced metering infrastructure project, the standard GLP meter will be able to provide the interval data to bill the Night Use Provision. These calculations are shown on lines 11-14 of Schedule SS-E10.

The proposed Distribution Revenues for Rate Schedule GLP from page 2 of Schedule SS-E9, less the Service Charge revenue, are designed to be recovered through the Distribution kW and kWh Charges. The current relationship in the recovery of Distribution costs between kW and kWh charges is being maintained in the proposed rate design. The amount allocated to be recovered through kWh charges was apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS.

The amount allocated to be recovered through kW charges was apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS. The Annual Peak Demand charge was calculated as the Local Delivery segment costs divided by the sum of the Rate Schedule GLP customers' billed Monthly Peak Demands.

The second demand charge, termed the Summer Demand Charge, is calculated as the System Delivery segment cost divided by the sum of the Rate Schedule GLP customers' billed Monthly Peak Demands for the four summer months, June through September.

The Company proposes to retain the provision for unmetered Police, Recall or Fire Alarm Service with all charges increased at the average Rate Schedule GLP distribution percentage increase.

Typical Rate Schedule GLP customer bill impacts as a result of these changes are shown on pages 8 and 9 of Schedule SS-E12.

Q. What other changes are you proposing to Rate Schedule GLP?

A. To correct an issue from the rate design approved in the 2018 Rate Case Order, the Company proposes to adjust the current GLP rates to rates that would have been in place as intended in 2018. From this new baseline, the proposed rate adjustments based on proposed revenue requirements can be calculated. The prior rate design inverted the intended distribution kWh Summer and Winter rates, and the implemented kWh Winter rate was lower than intended.

Rate Schedule Large Power And Lighting Service ("LPL")

Q. Please describe the rate design for Rate Schedule LPL.

A. The rate designs for Rate Schedules LPL-Secondary and LPL-Primary are shown starting on pages 20 and 24, respectively, of Schedule SS-E11.

The Service Charge has been set based on the per customer revenue requirements for the Access, Customer Service and Measurement segments and is shown in Schedule SS-E10 and increased in accordance with the limits previously discussed.

The Company proposes to continue the current provision that provides a reduced Service Charge for the closed provision for grandfathered LPL-Primary customers expected to have a peak demand of less than 100 kW. The Service Charge for this sub-class has been set based on the sum of the per customer revenue requirements for the Rate Schedule GLP Access

segment, Rate Schedule GLP Customer Service segment, and the Rate Schedule LPL-Primary Measurement segment, subject to the limits I discussed earlier.

The Proposed Distribution Revenues from LPL-Secondary and LPL-Primary service as set forth on page 2 of Schedule SS-E9, less the applicable Service Charge revenues, were designed to be recovered through the Distribution kilowatt charges. These remaining balances were apportioned between Local Delivery and System Delivery based on the revenue requirements for these segments from the Company COSS.

The Annual Peak Demand charge was calculated equal to the Local Delivery segment costs from the Company COSS divided by the sum of the LPL customers' billed Monthly Peak Demands that occur at any time during each month.

The second demand charge, termed the Summer Demand Charge, is calculated by dividing the System Delivery segment cost by the appropriate sum of the On-Peak Monthly Peak Demands for the four summer months, June through September.

Typical Rate Schedule LPL customer bill impacts as a result of these changes are shown on pages 12 and 14 of Schedule SS-E12.

Rate Schedule High Tension Service ("HTS")

Q. Please describe the proposed rate design for Rate Schedule HTS.

A. The rate design for Rate Schedules HTS-Subtransmission and HTS- High Voltage are shown starting on pages 28 and 32, respectively, of Schedule SS-E11.

The Service Charges and kW demand charges have been calculated and are proposed to apply on a similar basis for Rate HTS-Subtransmission and Rate HTS-High Voltage and Rate Schedule LPL. The only slight difference is that because customers on Rate Schedule HTS-High Voltage are served directly from transmission facilities, there are no System

Delivery revenue requirements, and thus there is no Summer Demand Charge necessary for Rate Schedule HTS.

Typical Rate Schedule HTS-S customer bill impacts as a result of these changes are shown on page 16 of Schedule SS-E12.

Payment Schedule Purchased Electric Power ("PEP")

Q. Is the Company proposing a change to Payment Schedule PEP?

A. The Company is proposing no changes to the Payment Schedule PEP.

ELECTRIC VEHICLE ("EV") COST OF SERVICE STUDIES ("COSS")

Residential Study

Q. Please describe how the Residential EV COSS was developed.

A. The residential electric vehicle ("Res-EV") COSS was developed using 12 months of electric vehicle charger data from August 1, 2022 through July 31, 2023. This period was utilized in place of the 2022 calendar year cost of service test year as the data was readily available and allowed for the largest sample size of customers with a full year of charging data.

The data was collected in 15-minute increments with each increment consisting of total kWh usage, average kW demand, and peak kW demand. Each increment was summed to hourly data, by customer and date. The final data set included data from 826 residential EV charging customers.

From this set of data, the sum of the individual customer peaks was totaled, as well as the coincident peak usage that occurred during the Company system peak that occurred Tuesday, August 9, 2022 from 4-5pm. Sum of peak data was used to determine the EV customer contribution to Local Delivery costs and Coincident Peak data was used to determine

the respective contribution to System Delivery Costs. From here, ratios were calculated to the total RS rate class Local Delivery and System Delivery functions.

Q. What were the results of the study?

A. Based on COSS results, the RS Local Delivery costs are equal to $470,258234 with a Res-EV Sum of Peaks ratio of 16,651 kW / 11,830,661 kW = 0.1407% or $661,857. Similarly, the total RS System Delivery costs are equal to $300,953,037 with a Res-EV Coincident Peak ratio of 34 kW / 4,362,852 kW = 0.0008% or $2,348 for a total Res-EV Local and System Delivery revenue requirement of $664,204. Over the year of usage, total Res-EV energy usage equaled 2,921,627 kWh, resulting in a COS energy rate of $0.227341per kWh, which is significantly above the proposed class average RS Rate Schedules Distribution kWh rate of approximately $0.058523 per kWh.

Q. Based on these results, are you proposing alternative rates for Residential EV charging?

A. Yes. As part of the proceeding, the Company is proposing a Residential TOU Program, which will offer off-peak rates that are significantly lower than current RS or RLM off-peak rates. Details on this Program are described further below in my testimony.

<u>Commercial & Industrial ("C&I") EV COSS</u>

Q. Please describe how the C&I EV COSS was developed.

A. The C&I EV COSS was performed in a similar matter to the Residential EV COSS, with the only exception being the date range and source of the data. C&I data consisted of data from July 1, 2022 through June 30, 2023 from 34 DCFC customers.

Based on COSS results, the LPL-S Local Delivery costs are equal to $102,876,070 with an DCFC-EV Sum of Peaks ratio of 17,678 kW / 2,893,512 kW = 0.6110% or $628,538. Similarly, the total LPL-S System Delivery costs are equal to $126,845,827 with a DCFC

Coincident Peak ratio of 6,187 kW / 1,946,767 kW = 0.3178% or $403,125 for a total DCFC Local and System Delivery revenue requirement of $1,031,663. Over the year of usage, total DCFC kWh equaled 30,361,295 kWh resulting in an effective COS energy rate of $0.033980 per kWh.

Q. Based upon the C&I COSS for DCFC customers, what does the Company propose?

A. The current rate structure for LPL-S is highly correlated to cost causation and is the ideal rate for all customers this size. However, to support the state's goal of promoting EV adoption and to ease cost burdens on DCFC customers during this early phase of market introduction of DCFC facilities, the Company is proposing a Distribution kWh charge to replace its Distribution Summer and Annual Demand kW charges for customer premises that only serve as DCFC facilities. Details of the proposed rate can be found on page - 57 - later in my testimony.

PROPOSED RESIDENTIAL TOU RATES

Overview

Q. Do you propose to include a Residential TOU Rates in PSE&G's tariff for electric service?

A. Yes. The Company will offer two new Residential TOU rates as described by Company witness Ahmad Faruqui, Principal Emeritus with The Brattle Group. The proposed tariff provision is consistent with the mechanism described by Mr. Faruqui and can be found in Figure 4 Summary of Current and Proposed RS Rate on page 13 of Exhibit P-10.

Q. Did you assist Mr. Faruqui in developing the proposed rates?

A. Yes. Mr. Faruqui and I worked closely in developing the proposed residential TOU rates which are discussed in more detail below.

Q. As part of the RS-TOU rates, are there any proposed changes to existing rate schedules?

A. The RS-TOU rates have been developed in a manner that provides for the closing of the RLM Rate Schedule to new customers once the RS-TOU is made available.

Q. Is it reasonable for the Board to consider approval of the proposed RS-TOU rates and corresponding rate design that you are proposing in this proceeding?

A. Yes. It is reasonable for the Board to consider the approval of the Proposed RS-TOU and corresponding rate design. The proposed RS-TOU rates align with cost causation, using cost-based rates developed by a COSS and rate design, as the Company is proposing in this filing, and sends the correct economic signals to customers, allowing them to make accurate economic decisions regarding their electricity usage and, as result, helps reduce future investment requirements and thus reduces future rates for all other customers. Adoption of the proposed RS-TOU rates will serve to encourage the most efficient use of electricity possible at a fair and equitable cost. Cost based rates provide a more fair and equitable allocation of costs across customers, support the correct economic customer decision making process regarding energy usage and related investments, and help keep rates more affordable.

Rate Design Detail

Q. What is the Company's proposal for new TOU rates?

A. The Company proposes two new voluntary residential TOU rates: a Two Period TOU Rate ("RS-TOU 2P") and a Three Period TOU Rate ("RS-TOU 3P").

The RS-TOU 2P has two periods, on-peak from 4pm to 9pm weekdays excluding PJM Holidays and off-peak all other hours.

The RS-TOU 3P rate has three periods, on-peak from 4pm to 9pm weekdays excluding PJM Holidays (same as RS-TOU 2P), off-peak from 12am to 6am and mid-peak for all other times.

Q. What are the objectives used to design these TOU rates?

A. The first objective of the TOU rates is to create rates that would provide customers with time of use pricing options that give customers options to move some of their discretionary, relative to timing, usage to non-peak times, where lower pricing could be offered reflecting the lower costs to serve during off peak times. These time-dependent price options may be of interest to those customers for whom the off-peak pricing meets their usage patterns or for those customers willing to modify their usage pattern to take advantage of the lower non-peak rates.

Q. What is the overall rate design philosophy for the proposed RS-TOU rates?

A. As described in the testimony of Mr. Faruqui, the overall rate design philosophy is to design the TOU rates to be revenue neutral to the aggregate RS Rate Schedule. This implies that the goal is that if the entire RS Rate Schedule would be served on either the RS-TOU 2P or 3P rate with no change is usage, the revenue collected from all customers would be the same.

Q. Can you describe the components of the proposed RS-TOU rates and how they were developed

A. Below is description of each rate component and the basis of how they were developed.

1. **Service Charge**: With the implementation of AMI meters, there is no difference in metering cost from a customer on the RS Rate Schedule. Therefore, the proposed service charge for both the RS-TOU 2P and RS-TOU 3P rates will be identical the RS Rate Schedule service charge.

2. **Distribution Energy kWh Charges**: System Delivery Distribution costs are allocated to customers based upon the customers contribution to Coincident Peak Demand. Since PSE&G uses energy (kWh) charges instead of demand or obligation charges to recover

this cost, the closest rate to collect these costs would be the Summer on-peak kWh charge. However, this would result in a very high summer on-peak kWh charge. To mitigate the difference between the summer and winter charge and still have the price signal aligned with cost causation, the System Delivery component was allocated 1.5 times more to the Summer on-peak vs. the on-peak winter period. Then an adjustment factor was used to ensure that the System Delivery Costs in the proposed RS-TOU rates are equal to the System Delivery costs embedded in the proposed RS Distribution kWh rates.

Local Delivery Distribution costs are allocated to rate schedules by the sum of customers' individual peaks in the rate class. Since individual customer peaks can happen at any time and consistent with the current RS Rate Schedules rate design, the Company proposes to recovery this cost over all energy usage. However, to still send the proper price signals to customers and to minimize the mid and off-peak rates, these costs were also ratioed between time periods. For the RS-TOU 3P rate, the on and mid-peak rates were designed to be two times the off-peak rate. To keep the on-peak rates the same between the 2P and 3P rates, the on-peak contribution of Local Delivery costs designed for the 3P rates was used for the RS-TOU 2P rate with the balance of Local Delivery cost recovered in the longer RS-TOU 2P off-peak period. Then an adjustment factor was used to ensure that the Local Delivery Costs in the proposed RS-TOU rates are equal to the System Delivery costs embedded in the proposed RS Distribution kWh rates.

The proposed RS-TOU Distribution kWh rates without and with SUT are shown below in Table 1.

5n7		$/kWh - w/o SUT	
Rate	Period	Summer	Winter
Distribution	on peak	0.196495	0.144223
3P	mid peak	0.039678	0.039678
	off-peak	0.019839	0.019839
Distribtuion	on peak	0.196495	0.144223
2P	off peak	0.034808	0.034808

5n7		$/kWh - w/ SUT	
Rate	Period	Summer	Winter
Distribution	on peak	0.209513	0.153778
3P	mid peak	0.042307	0.042307
	off-peak	0.021153	0.021153
Distribtuion	on peak	0.209513	0.153778
2P	off peak	0.037114	0.037114

Table 1

The calculation for these distribution rates can be found in workpaper WP-SS-TOU.xlsx.

3. **Supply Charges:** Since Supply rates are determined in BGS proceedings, I developed estimated Transmission and Generation rates, which are revenue neutral to RS rates, to calculate total bill impacts for these proposed rates. The development of the supply rates can also be found in workpaper WP-SS-TOU.xlsx. The Company intends to propose corresponding generation and transmission RS-TOU rates in future BGS proceedings.

Program Details

Q. Which customers could utilize the proposed RS-TOU rates?

A. Any residential customer could choose to be served under this proposed rate.

Q. Would customers be defaulted to RS-TOU rates?

A. No. These rates will be entirely voluntary opt-in options, with no customers defaulted into or required to move to these rates.

Q. Would customers be able to move back to the RS Rate Schedule?

A. The Company proposes that for each residential customer that opts into one of the two new RS-TOU rates, at the end of the initial 12 month period, the Company will provide each customer with reporting showing his or her 12 month bill on the new RS-TOU rate and what this 12 month bill would have been on the RS Rate Schedule. The customer will be offered a one-time refund of the difference if the 12 month bill on the RS-TOU rate was higher compared

to the RS Rate Schedule. This initial 12 month look back provision is incorporated to encourage customers to be more willing to try the RS-TOU rates knowing they will not be financially disadvantaged, and after the initial 12 month period, customers can chose to revert back to the RS Rate Schedule if they wish. The initial 12 month look back provision would only be available to customers who take service under either RS TOU rate during the first 24 months that the rate is available to customers.

Q. Is there any requirement to stay on the rate for any period of time?

A. There will be a requirement for customer to stay on the new RS-TOU rate for a period of 12 months. After being on the rate for a minimum of 12 months, customers would also be able to choose to switch back to the RS Rate Schedule at any time.

Q. What is the estimated implementation cost for these new T OU rates?

A. The new AMI meter system provides more detailed metering data that enables TOU rates and creates the ability to bill time of use rates in the Customer System. Once the proposed rates are approved as part of the rate case, new billing logic that meets stringent financial testing and SOX control standards will require an IT programming, testing and training effort. Also, the 12 month look back provision adds a layer of programming complexity as well. The initial estimate to be able to implement the proposed TOU rates is approximately $1.9 million..

Additionally, IT system changes are required to enable changes to a customer's rates without the need to change the customer's meter. This capability had previously been planned for a later phase of AMI use case deployment and is not currently not one of the 22 AMI Use Cases included in the CEF-EC program.[5] To support efficiency in administration of the

[5] See testimony of Company witness Johnson regarding the 22 AMI Use Cases that are part of the CEF-EC program.

proposed TOU rates, PSE&G recommends including these system changes in the CEF-EC program for deployment by the end of 2024, and requests the BPU's support for this approach.[6]

Q. What would be the time frame to be able to offer new RS TOU rates?

A. The project to implement the new RS-TOU Program would begin upon the effective date of this filing. It is currently estimated to take nine to twelve months after approval of the filing to make the RS-TOU Program available to customers.

Q. Is the Company proposing a customer communications plan for introducing the availability of the new RS-TOU Program and associate rate options?

A. In the several months before the RS-TOU rates become available, the Company will perform an initial awareness communications plan to all residential customers utilizing varied channels such as the web, bill messages, bill inserts, and digital advertisements at an estimated cost of $2.0 million. After the kickoff campaign, additional awareness campaigns would be done at regular intervals for the next two years at an estimated $500,000 per year. Additionally, there will be certain targeted communications to those customers identified as likely to be interested in the TOU rates, such as EV customers.

Q. What assumptions has the Company made regarding customer adoption of TOU rates?

A. The Company has proposed entirely voluntary adoption for residential TOU rates and not made any assumptions or targets for residential customer signups. It is assumed that the TOU rates will be of interest to price sensitive customers with usage that allows them to move that usage to off-peak periods. Some percentage of EV owners looking to save money would be likely adopters.

[6] This work can be managed within the existing CEF-EC program budget.

Q. Will there be increased expenses associated with the introduction and support of TOU rates?

A. Yes. Aside from the implementation and communication costs, there will be additional incremental costs related to supporting customers through these TOU options. While self-serve options such as an online rate analyzer will be available, it is anticipated that TOU options will drive increased calls from customers with questions. Additionally, the transitional items being offered, providing the 12 months bill comparison, possible refunds, and ability to change rates, will drive incremental calls and additional work in the billing department to support customers through this transition as customers get comfortable with TOU rates. In the initial three years of the TOU introduction, these incremental expenses are estimated to be in the range of $1.7 million to $3.3 million annually, including risk and contingency.

Q. Has the Company incorporated these RS-TOU rates into the calculated revenue requirement?

A. No. These rates have been designed to be revenue neutral with the proposed RS Rate Schedule, so there was no need for a change to the calculated revenue requirement based on the new TOU rates.

Q. How will the revenue collected under the RS-TOU 2P and RS-TOU 3P Rate Schedules be treated for the Conservation Incentive Program ("CIP")?

A. Since these TOU rates have been developed to be revenue neutral relative to the RS Rate Schedule, the Company is proposing to treat the new TOU Rate Schedule as customers served under the RS Rate Schedule. Therefore, the net distribution per customer will be based upon the RS Rate Schedule revenue per customer and the Company will have the same financial incentive to serve a residential customer either on the RS or RS-TOU rates.

Q. Can you please summarize all the estimated expected costs to implement the RS-TOU?

A. All of the estimated expected costs to implement Residential TOU for the first three years is estimated to total $12.4 million.

Q. How does the Company propose to recover the implementation costs associated with the new RS-TOU rates?

A. The Company proposes that the implementation costs be deferred with all the corresponding regulatory assets earning carrying charges at the Company's latest approved WACC. These costs and corresponding regulatory assets would be reviewed for prudency and cost recovery in the next base rate case.

Q. How does the Company propose to recover the customer support and customer communication and education expense costs associated with the new RS-TOU rates?

A. The Company proposes that the implementations costs be deferred and reviewed for prudency and recovery in the Company's next base rate case.

PROPOSED DCFC DISTRIBUTION KILOWATT-HOUR CHARGE

Q. Have you proposed a new Distribution kWh charge for customers who receive service solely as a DCFC facility serviced under the LPL-S Rate Schedules in lieu of the current annual and summer demand charges?

A. Yes.

Q. Can you please describe the charge?

A. As described in the C&I EV COSS section on page - 49 -- 49 - earlier in my testimony, the kWh cost-based rate based upon the historic usage of 34 DCFC customers is $0.033980 per kWh without SUT. To develop a Distribution kWh rate that is comparable to the current Annual and Summer Demand Charge for the LPL-S Rate Schedule, the rate is adjusted for the ratio of the proposed LPL-S Annual and Summer Demand Revenue of $215,064,000 versus

its cost to serve of $229,721,897 or 0.93619. As a result, the proposed DCFC Distribution kWh charge is $0.031812 per kWh without SUT ($0.033920 per kWh with SUT).

STREETLIGHTING CHANGES

LED Street Lighting

Q. Is the Company proposing changes to Streetlighting Rate Classes?

A. The Company proposes to no longer offer standard, non-LED streetlights in the BPL (Body Politic Lighting Service) and PSAL (Private Street and Area Lighting Service) Rate Schedules for new installations. The Company would continue to provide only maintenance and electric delivery service for existing non-LED luminaires that began taking service prior to the Board's approval of this proposal. The Company will not proactively replace functioning non-LED luminaires.

Q. Why is the Company proposing this?

A. This is being done to encourage the transition tor energy efficient LED luminaires and the anticipated lack of availability and the cost of non-LED luminaires, upon approval by the Board.

Q. Other than the changes to the charges under the Street Lighting Rate Schedules, what other changes is the Company proposing as part of this filing?

A. The Company proposes that during any future maintenance activities on an existing non-LED Luminaire (bulb, photocell, or fixture failures), the Company may, at its sole discretion, replace a non-LED streetlight luminaire with an equivalent LED streetlight luminaire.

Q. What are the changes to the Streetlighting Tariff?

A. PSE&G proposes to close all non-LED Luminaires within the BPL and PSAL Rate Schedules and add new LED Luminaires.

Q. Are there energy efficiency and environmental benefits from the deployment of LED Luminaires?

A. Yes. LED luminaires are environmentally friendly as they reduce energy consumption and therefore carbon dioxide emissions. Also, LED luminaires are effective at managing light pollution.

Q. What are the implications with respect to the streetlight assets associated with the replacement of the non-LED luminaires with LED luminaires?

A. PSE&G's current streetlighting rate schedules provides that "Public Service has the right to replace obsolete luminaires, poles and all other associated equipment with equivalent equipment without the consent of its customers." PSE&G considers all non-LED luminaires that have an LED equivalent to be obsolete equipment and subject to replacement with an equivalent LED Luminaire, opportunistically when repairs or replacements are needed. PSE&G proposes a change to the tariff to move all obsolete fixtures to the closed section of their respective tariffs.

Q. How will the change from non-LED luminaire to new LED luminaire fixture due to any type of failure (bulb/photocell/luminaire) in the normal course be handled from an accounting perspective?

A. The non-LED luminaire will be retired in the normal course of business.

Q. Will the company incur incremental costs by replacing existing non-LED luminaires failures with an LED luminaire?

A. While the Company manages its current non-LED inventory prudently and will try to minimize the amount inventory in anticipation of the changes discussed above, it is likely there would some amount of obsolete inventory that would result in an inventory write-off and associated incremental expense.

Q. How does the Company propose to recover these costs?

A. PSE&G proposes to defer these costs for recovery in the Company's next base rate case.

Rate Schedule Body Politic Lighting Service ("BPL")

Q. Please describe the rate design for Rate Schedule BPL.

A. As stated previously in my testimony, the Company is proposing to close the non-LED luminaires in the BPL Rate Schedule upon approval by the Board. Since the Company is proposing closed all non-LED luminaires and its present revenue is close to its cost to serve, , the Company proposes to limit the Distribution Charge utilizing the standard increase limits and to increase the Monthly Charges for poles and luminaires by an overall increase of 10% of revenue .

The results of the Rate Schedule BPL rate design are shown on page 37 of Schedule SS-E11. The general format of the calculations is described on the first page of that Schedule. In accordance with the Stipulation approved by the BPU in Docket No. ET01120830, the Company offers four distinct service offerings of luminaires and poles under rate schedule BPL, each necessitating a unique set of prices, as follows:

- Specialty luminaires and poles having more than 50 units in service or new LED luminaires,
- LED luminaires and poles that are currently in the Tariff
- Current specialty luminaires and poles;
- Standard and luminaires and poles no longer available.

The first service offering is for LED luminaires and poles that are currently billed as specialty units and meet the 50-unit breakpoint discussed above or new LED luminaires that will take the place of equivalent non-LED units. These facilities are proposed to be offered as

standard units whose price will be listed in the tariff. The units are referred to in the workpapers as "Tariff New." Units already installed and being billed to customers will continue to be billed at the current customer specific charges already established. The individual tariff prices for these units are the greater of either the levelized annual revenue requirement of current costs calculated at Company's proposed overall rate of return, or the highest price charged to an existing specialty customer. .

The second service offering is for luminaires and poles that appear in the Rate Schedule BPL as Standard items and are referred in the workpapers as "Tariff Existing" Since we are propsing to close all non-LED luminaires, only the exiting tariff LED luminaries and poles are in this set. Unit prices for these facilities were first calculated for different luminaire or pole types based on the levelized annual revenue requirement of current costs calculated at the Company's proposed overall rate of return. Proposed changes in the individual Standard pole charges were limited to a range to ensure an aggregate increase 10% to all luminaire and pole revenue.

The third service offering is for current Specialty units, which are referred to in the workpapers as "Specialty." Units of this type already installed and being billed to customers will continue to be billed at the current customer specific charges. New Specialty units will be offered for installation after the conclusion of this proceeding and will follow the same customer specific formula as detailed in the Rate Schedule. The only change proposed for this service offering is an updated Maintenance Charge as set forth in the Rate Schedule.

The final type of offering is for current standard units that are no longer available for new installations. As previously discussed, this will include all non-LED luminaires such as Incandescent, Mercury Vapor, Metal Halide, High Pressure Sodium or Induction, units as well

as some obsolete LED units. These are referred to in the workpapers (and in the Tariff) as "Tariff Closed" units.

For these proposed "Tariff Closed" standard non-LED luminaries, prices were adjusted to ensure that the total bill for the new LED equivalents would be equal to or lower than the proposed non-LED total bill. The remaining non-standard Tariff Closed items were adjusted to ensure that the overall luminaire and pole increase will be limited to a range to ensure an aggregate increase of 10% to all luminaire and pole revenue.

The final proposed individual LED luminaire and pole charges for "Tariff Existing" items were determined through iteration, subject to the limits discussed above, such that the overall proposed distribution revenue target for Rate Schedule BPL from page 2 of Schedule SS-E9 was achieved.

The distribution costs related to the use of the electric distribution system to deliver electricity to the streetlights are calculated by dividing the revenue requirements from the Local Delivery and System Delivery segments by the total kWh delivered. The Maintenance Charges that are listed in Rate Schedule BPL for use in calculating specialty prices and included in the charges for standard luminaires and poles were updated based on the latest information from the Company's accounting records.

Rate Schedule Body Politic Lighting Service From Publicly Owned Facilities ("BPL-POF")

Q. Please describe the rate design for Rate Schedule BPL-POF.

A. The Company closed this Rate Schedule at the conclusion of the 2018 Rate Case. and the rate class is grandfathered to premises receiving service only up to the date of October 31, 2018. Under Rate Schedule BPL-POF, the Company continues to provide only maintenance and electric delivery service for existing publicly owned street lighting systems that began

taking service prior to the closing date of October 31, 2018. The Rate Schedule includes monthly charges for those luminaire types presently being served.

The distribution costs for this service are related to the use of the electric distribution system to deliver electricity to the streetlights and are calculated by dividing the revenue requirements from the Local Delivery and System Delivery segments divided by the total kWh delivered.

The fixed per unit charge for each luminaire is designed to provide for recovery of only the maintenance costs associated with providing service. The Company has no investment in the luminaires because all equipment is supplied, installed, and owned by the customer. The unit prices for each luminaire type were set in a manner identical to that of the Maintenance Charge for Rate Schedule BPL to recover the Proposed Distribution Revenue for Rate Schedule BPL-POF as set forth in page 2 of Schedule SS-E9.

The Company proposes this class receive the overall average Distribution percentage increase as shown in Column 7 of Page 2 of Schedule SS-E9. Similar to Rate Schedules BPL and PSAL, the Company proposes to increase the Distribution Charge per kWhutilizing the standard increase limits, the Monthly Charges per Unit to recover the remainder of the revenue for this rate schedule.

Rate Schedule Private Street and Area Lighting Service ("PSAL")

Q. Please describe the rate design for Rate Schedule PSAL.

A. The rate design used for Rate Schedule PSAL individual luminaires and poles is similar to the method used for Rate Schedule BPL individual luminaires and poles. The only difference is that because this type of lighting service is optional, as customers may install their own systems that provide comparable lighting, it is appropriate that overall pricing of Rate Schedule PSAL should not be limited to the cost based revenue requirements as indicated by

the COSStudy. The only difference for PSAL compared to BPL is the proposed changes for individual Standard pole charges were limited to a range to ensure an aggregate increase of 20.607% to all luminaire and pole revenue. This is shown on Column 7 of Page 2 of Schedule SS-E9.

The distribution costs for this service are related to the use of the electric distribution system to deliver electricity to the streetlights and are calculated by dividing the revenue requirements from the Local Delivery and System Delivery segments by the total kWh delivered.

RATE DESIGN FOR FUTURE ADJUSTMENT BETWEEN BASE RATE CASES

Q. Will the same method for revenue changes being proposed in this proceeding be used for future rate adjustments for IIP Proceedings and similar base rate adjustment programs prior to the conclusion of the next base rate?

A. While the method would be similar, the Company is proposing minor modifications that were used in similar rate adjustments since the 2018 base rate case.

Q. What modifications is the Company proposing?

A. Since the Streetlighting Rate Schedules (BPL, BPL-POF and PSAL) Luminaire and Pole Charges are specifically intended to recover the costs for those assets and have no cost relationship to investments being made in the Company's IIP proceedings and similar base rate adjustment programs, the Company proposes to exclude the luminaire and pole revenue from being included in the interclass revenue allocation for the corresponding future rate increases. Only the Distribution Charge revenue for the Streetlighting Rate Schedules would be included utilizing the same interclass revenue increase limits and the same rate design method specifically to the Distribution Charges proposed in this proceeding.

TAX ADJUSTMENT CREDIT ("TAC")

Q. Please briefly describe the TAC Mechanism.

A. The TAC mechanism was established in the 2018 Rate Case Order, to flow back certain tax benefits to customers.

Q. Please briefly describe PSE&G's proposed TAC adjustments.

A. As described in more detail in the testimony of Mr. Pardo, the Company is proposing the following adjustments to the TAC:

1) In addition to continuing to flow back the benefit of the historic Safe Harbor Adjusted Repair Expense ("SHARE") deduction, the Company proposes to flow back to customers the net federal tax benefit associated with the historical Mixed Service accumulated deferred income taxes ("ADIT") balance over approximately five years.
2) The Company proposes to add the current Mixed Service deduction net benefit to the current SHARE deduction net benefit already included in the TAC, but both at a pre-determined, fixed annual amount, with any excess to be flowed back to customers in a subsequent rate case; and
3) To better match the seasonal flow of Company pre-tax income, the Company began to amortize the monthly flow back of excess deferred income taxes ("EDIT") and SHARE on a seasonal basis in the 2023 TAC filing to match pre-tax income as described in the 2023 TAC cost recovery proceeding. In this proceeding, the Company is aligning the return calculation with the seasonal amortization methodology.

Q. Does the Company have an amortization schedule for the proposed amortizations?

A. Yes, the proposed amortizations are included in summary format in rows 167-170 in worksheet 'RevReq-E' of WP-SS-TAC-1.xlsx for 2025 through 2028.

Q. How does the Company propose to modify the TAC revenue requirement formula based upon the changes discussed previously?

A. The TAC revenue requirement formula is calculated monthly and will be modified with the ***bolded items*** below:

> *TAC Revenue Requirement = (Amortization of Protected ADIT Balance +(Amortization of Historic SHARE ADIT) Balance +* ***(Amortization of Historic MSC Deduction ADIT Balance*** *+ After-tax Return on Cumulative Historic SHARE Deduction ADIT Change +* ***After-tax Return on Cumulative Historic MSC Deduction ADIT Change*** *+* ***Pre-set*** *SHARE Deduction Flow-Through +* ***Pre-Set MSC Deduction Flow-Through*** *+ IRS Audit Electric Adjustments + Other Major Electric Tax Adjustments)* ******* *Electric Revenue Factor*

See Schedule SS-TAC-2E for the monthly net revenue requirement calculations.

Q. What is the TAC amount for the initial period after base rates are projected to take effect in this proceeding?

A. The electric net revenue requirement for the initial 16-month period of September 1, 2024 through December 31, 2025 is a credit to electric customers of $174.4 million or $132.4 million on an annualized basis. See Schedule SS-ETAC-1.

DISTRIBUTION ADJUSTMENT CHARGE AND STORM RECOVERY CHARGE ("SRC")

SRC Mechanism

Q. Please briefly describe the Company's proposed SRC.

A. As described in the testimony of Mr. McFadden, the Company is proposing a SRC to:

1. Recover the deferred major storm costs that have been incurred since 2018 with interest.

2. Defer and then recover future major storm costs, including interest, through subsequent true-up filings.

Q. Please describe the methodology used to calculate the SRC recovery.

A. The Company is proposing a new Distribution Adjustment Charge ("DAC") clause in its electric tariff with the SRC as a new component of the DAC. The DAC was proposed by the Company in its COVID-19 cost recovery filing where COVID-19 Recovery Charge would also be a component of the DAC. The details of the SRC and the recovery mechanism are described below. The following formula describes the SRC mechanism:

SRC Balance = Prior Month SRC Balance – SRC Revenue + Incremental Deferred Major Storm Costs + Interest Expense

Q. How will the SRC be charged or refunded to customers?

A. The Company proposes to charge or refund the SRC through a new component of the Company's proposed DAC in the Company's electric tariff. The charges will be applied to each kWh of a customer's usage and will apply to all electric customers.

SRC Components

Q. What is the Initial SRC Balance?

A. The Initial SRC Balance is the total incremental deferred major storm costs associated with major storms since the Company's last Base Rate Case in 2018 prior to the implementation of the SRC rate.

Q. What are the "Incremental Deferred Major Storm Expenses?"

A. The Incremental Deferred Major Storm Costs are those monthly costs that occur after the implementation of the SRC rate.

Q. What is the "Interest Expense?"

A. The Interest Expense is the monthly carrying costs related to the SRC Balance. It is calculated as following ((Prior Month SRC Balance + (– SRC Revenue + Monthly Activity +

Prior Month SRC Balance)) / 2) x (Annual Interest Rate / 12). In calculating the Interest Expense, the annual interest rate is based upon the Company's interest rate obtained on its commercial paper and/or bank credit lines utilized in the preceding month. If both commercial paper and bank credit lines have been utilized, the weighted average of both sources of capital shall be used. In the event that neither commercial paper nor bank credit lines were utilized in the preceding month, the last calculated rate will be used. The interest rate shall not exceed PSE&G's overall rate of return as authorized by the Board as utilized in calculating revenue requirements for the corresponding period. The calculation of the monthly interest can be found in Schedule SS-SRC-1E, Page 1.

Q. How does the Company propose to calculate the initial SRC Rate?

A. The Company proposes to set the initial SRC Rate to recover these costs over a three-year period including interest. The rate will be a rate applied to all electric customer. See Schedule SS-SRC-1E, Page 2 for the calculation.

Q. When does the Company propose to submit subsequent SRC filings to change the SRC?

A. The Company plans to submit a periodic SRC filing to change the SRC rate if warranted based upon the projected SRC over/under balance.

Q. When will storm costs be reviewed for prudency?

A. The Company proposes that all storm costs will be reviewed as part of subsequent SRC filings.

Q. When is the initial implementation of the SRC anticipated to occur?

A. The SRC is proposed to be effective September 1, 2024 corresponding to the change in base rates as a result of this proceeding. If the Board approves new base rates earlier or later

than September 1, 2024, the initial rate period and corresponding rate will be adjusted accordingly from the effective date of the Board Order.

Q. What is the SRC amount for the initial period after base rates are projected to take effect in this proceeding?

A. The electric net revenue requirement for the initial annual period of September 1, 2024 through August 31, 2025 is a charge to electric customers of $38.0 million. See Schedule SS-SRC-1E.

TARIFF CHANGES

Q. Are you proposing any further changes to the proposed tariff?

A. Yes. Please refer to the Guide to Electric Tariff Changes, Exhibit P-1 Schedule 2.

LOSSES

Q. Is the Company proposing to update electric losses?

A. No, the Company is not proposing any update to electric losses in this proceeding.

CLEAN ENERGY FUTURE – ELECTRIC VEHICLE ("CEF-EV") FUTURE RATE ADJUSTMENT MECHANISM

Q. Why is the Company proposing a future rate adjustment mechanism in the filing?

A. In accordance with the CEF-EV Order, the Company anticipates that expenditures on the CEF-EV program will extend more than six months beyond the end of the test year and require annual rate adjustment filings. As stated in the CEF-EV Order, paragraph 24:

> CEF-EV investment that is not likely to be in-service by the end of six (6) months after the end of the test year, shall be deferred and placed in a regulatory asset. The Signatory Parties agree the Next Base Rate Case will remain open so that CEF-EV investment placed in service more than six (6) months after the end of the test year in the Next Base Rate Case will be reviewed and placed into rates, if deemed reasonable and prudent, as soon as practicable after the associated infrastructure has been placed into service, through annual roll-in filings following the Next Base Rate Case. The annual roll-in filings will include three (3) months of forecast data that

will be trued-up with actual data no later than 20 days after the end of the final forecast month. The annual roll-in filing will request that new rates be implemented three (3) months after the end of the final forecast month. The schedule of such annual roll-in filings shall be determined in the Company's Next Base Rate Case.

Q. What costs will be included in the future CEF-EV rate adjustments?

A. The CEF-EV Order permits the Company to recovery the following assets in future rate adjustments.

1. Portions of Pole to Meter ("PTM") investments that would have been collected via Contribution in Aid of Construction ("CIAC") payments from CEF-EV participants.
2. The regulatory assets from the deferral of the Behind the Meter ("BTM") rebates to CEF-EV participants.
3. The regulatory asset from the deferral of the Depreciation and Amortization expense associated with the assets from Item 1 and 2 above.
4. IT Investments that were made to support the program
5. The regulatory asset from the deferred return on the Items 1 through 3 above.
6. The regulatory asset from deferred Program O&M expense

Q. How does PSE&G propose to calculate the revenue requirements?

A. PSE&G proposes to calculate the revenue requirements associated with the CEF-EV's costs using the following formula:

*Revenue Requirements = ((Rate Base * Rate of Return) + Net of Tax Amortization and/or Depreciation + Tax Adjustment)* Revenue Factor*

This calculation is similar to the calculations utilized in PSE&G's Infrastructure Programs as approved by the Board in their respective Board Orders. The Company proposes to recover the revenue requirements through annual rate adjustment filings as described below, consistent with the Order approving the Program.

Q. Please describe the components and defined terms in PSE&G's proposed revenue requirement calculation.

A. The following is a description of each term proposed in PSE&G's revenue requirement calculation.

The term "Rate of Return" is PSE&G's overall weighted average cost of capital ("WACC") for the Program. PSE&G is proposing a return on its CEF-EV rate base based upon an authorized return on equity ("ROE"), Long Term Debt, Customer Deposits and corresponding capital structure including income tax effects. The Company proposes to utilize the latest WACC authorized by the Board in the Company's base rate case proceeding(s). See Schedule MPM-04 for the calculation of the proposed WACC utilized in the revenue requirement calculation. Any change in the WACC authorized by the Board in any subsequent electric, gas, or combined base rate case would be reflected in the appropriate corresponding rate adjustment filing explained in more detail below. Any changes to current Federal or State tax rates would also be reflected in an adjustment to the WACC. Additionally, the Company is proposing that for these future CEF-EV rate adjustments, the embedded cost of long-term debt should be the actual rate at the time the Company submits its update for actual results in the associated proceeding.

The term "Rate Base" refers to Gross Plant from the assets described earlier less the associated accumulated depreciation and/or amortization and less Accumulated Deferred Income Taxes ("ADIT"). Gross Plant is equal to all the assets described above and Allowance of Funds Used during Construction ("AFUDC") – both debt and equity components.

ADIT is calculated as Book Depreciation (Tax Basis) less Tax Depreciation, multiplied by the Company's effective tax rate, which is currently 28.11%. Cost of Removal expenditures

are depreciated 100% in the year incurred for tax purposes. Please see Table 2 below for the book and tax depreciation rates for each asset, which were approved in the CEF-EV Order.

Asset	**Annual Book Depreciation Rates**	**Tax Depreciation Years/Type[7]**
Pole to Meter	2.00%	20 / MACRS
IT Investments	3.33%	3 / SL
Regulatory Asset (excl. O&M)	3.33%	Expense
Regulatory Asset - O&M	20%	Expense

*Based on investment based weighted average of EV Depreciation Rates

Table 2

Any future changes to the book, or tax depreciation rates, such as, but not limited to, reinstatement of "bonus depreciation" during the construction period of the Program and at the time of each base rate adjustment, will be reflected in the accumulated depreciation and/or ADIT calculation described above. The "Net of Tax Depreciation and/or Amortization" allows for recovery of the Company's investment in the Program assets over the useful book life of each asset class. For Plant in Service investment, the net of tax depreciation expense is calculated as the depreciation expense multiplied by one minus the current tax rate. Any future changes to the book depreciation or tax rates during the construction period of the Program and at the time of each base rate adjustment, would be reflected in the net of tax depreciation expense calculation described above.

The term "Tax Adjustment" refers to any applicable tax items that may impact the revenue requirement calculation for the Program.

The "Revenue Factor" adjusts the Revenue Requirement Net of Tax for federal and state income taxes, the BPU and Rate Counsel ("RC") Annual Assessments Fees. The tax rates reflect the current federal tax rate of 21%. The BPU/RC Assessment Expenses consist of

[7] "MACRS" = Modified Accelerated Cost Recovery System, "SL" = Straight Line

payments, based upon a percentage of revenues collected (updated annually), to the State based on the electric and gas intrastate operating revenues for the utility. The Company has utilized the respective BPU and RC assessment rates based on the 2023 fiscal year assessment. Any future changes impacting the revenue factor during the construction period of the Program and at the time of each base rate adjustment, would be reflected in the revenue factor described above.

Q. Do you provide a schedule showing a sample calculation of the revenue requirements?

A. Yes. See Schedule SS-CEF-EV-1 for a sample calculation of future revenue requirements for the CEF-EV program.

Q. How does the Company propose to recover the revenue requirements as described above?

A. The Company proposes to recover the revenue requirements associated with the Program via new CEF-EV rate components of its Infrastructure Investment Program Charges ("IIPCs") for the Electric Tariff. While not an IIP, this mechanism will allow for the inclusion of the CEF-EV rate adjustments into base rates.

The filing schedule based upon the Initial Filing date along with corresponding timing for, Investment as Of, Update for Actuals Filing, and Rates Effective dates for all electric and electric rate adjustment filings, assuming Board approval of this proceeding by September 1, 2024, is listed in the table below.

Each Initial Filing shall provide the actual cost and forecast for investment data, revenue requirement calculations, proposed CEF-EV rates, and related data to support rates based on CEF-EV costs.

The Update for Actuals Filing, updates all forecasted cost and investment data, revenue requirement calculations, proposed CEF-EV rates, and related information from the Initial

Filing to data based on all actual historical data. CEF-EV investments included in rates in the Update for Actuals Filing shall only include CEF-EV investment not in the Company's base rates and actually placed in-service according to the schedule below.

The Rates Effective dates for each filing below shall be as indicated in Table 3 below – the first day of the month following five months following the due date of the Initial Filing. The Company proposes three rate adjustment filings with dates to be determined based upon 60 days notice prior to the initial filing. Table 3 below shows the Company's proposed filing timeline for each rate adjustment filing.

CEF-EV Rate Adjustment Schedule			
Initial Filing	**Investment as Of**	**Update for Actuals Filing**	**Rates Effective No Earlier Than**
TBD	TBD + 2 mo	TBD + 3 mo	TBD + 5 mo + 1 Day

Table 3

Q. What rate design is the Company proposing to use for this base rate adjustment?

A. The Company proposes to use the rate design from the most recently approved base rate case proceeding.

Q. What will be the source of the capital expenditures you use to calculate the revenue requirements for future CEF-EV adjustments?

A. The actual and projected monthly cash flows for the Program will be provided in separate testimony from the CEF-EV Program witness.

Q. Will the Company continue to calculate a monthly investment deferral on CEF-EV investments that are recovered in base rates or future rate adjustments?

A. No. Once investment is included in customer rates through a base rate case proceeding or future rate adjustments, it will be excluded from the CEF-EV Monthly Investment Deferral calculation described above.

Q. How will the CEF-EV Regulatory Asset be reflected in subsequent base rate case proceedings?

A. Consistent with the CEF-EV Order, the Company will continue to seek recovery of and on the unamortized CEF-EV Regulatory Asset. This will include any Deferred Monthly Investment not yet recovered in rates and return on the unamortized CEF-EV Regulatory Balance as a component of rate base in the same manner as any other Utility Plant.

STAFF COSS METHODOLOGY

Q. Please explain why you are conducting the Staff COSS.

A. In the 2018 Rate Case proceeding, the Company agreed to perform a COSS in the manner prescribed by Staff. In accordance with this requirement, the Staff COSS and the summary of the resulting functional revenue requirements by rate class are being submitted with the Company's rate case filing. Specifically, Schedule SS-E13 contains the details of the complete COSS utilizing Staff's Method, Schedule SS-E14 is the Summary Report by Functional Segment based on Staff's Method, Schedule SS-E15 is the Functional Cost Summary of the Cost of Service Study results based on Staff's Method, and Schedule SS-E16 contains the Service Charge Calculations based on Staff's direction.

In the Stipulation that resolved the 2018 Rate Case, the parties made it clear that they were not agreeing that the Staff COSS was appropriate, was consistent with cost causation principles, or would be a useful guide in determining just and reasonable rates. Specifically, the Stipulation stated (at 11-12):

> All parties will be free to submit any number of alternative cost of service methodologies for the Board's consideration in future cases. The Company and

any Signatory to this agreement will have the right to file and support any COSS method it considers appropriate.[8]

Q. Does the Company believe that the Staff COSS provides a reasonable foundation for establishing just and reasonable rates in this proceeding?

A. No. The Staff COSS Methodology is not an appropriate methodology to use to establish just and reasonable rates because it does not achieve a result that is tied to cost causation. Instead, the Staff COSS method goes to great and often extraordinary lengths to allocate and functionalize costs away from residential customers and onto the shoulders of commercial and industrial customers. While it may be reasonable to moderate the level of increase to be borne by residential customers, the vehicle for doing so should not be a COSS that transfers costs to businesses operating in the Company's service territory. The Company has taken reasonable steps to moderate the increase in rates for Rate Schedules RS and GLP customers with its gradualism-based recommendations that limit the increases for those classes.

Q. What is the primary reason that you believe that the Staff COSS is inappropriate?

A. The fundamental error in Staff's Method for the vast majority of costs is that it proceeds from an assumption that a significant portion of the cost of electric distribution assets should be allocated to the rate classes based on the amount of energy consumed by each class. This general method is applied to virtually all assets in FERC Accounts E360 to E368, which comprise about 81% of the Company's total gross electric plant.

The method used in the Staff COSS to functionalize and allocate most costs has existed for many years and is usually referred to as the "Average and Excess" methodology. However, historically the "Average and Excess" method was used to allocate costs of electric generation

[8] 2018 Rate Case Order at Stipulation ¶ 25.

plant and gas production facilities where arguably there is an energy component because there is investment beyond that necessary to provide capacity at the time of peak load. There is no linkage between this methodology and electric distribution plant costs or operations. Contrary to the assumptions underlying the Average and Excess method, the Company's distribution planners and designers plan and install facilities to meet the peak demands of customers. The design of those facilities is not based on the amount of energy (kWh) they consume.

Chapter 6 of the NARUC Manual, which the Company has generally relied on for functionalization and allocation concepts, describes in detail various methods of functionalizing (or classifying) and allocating electric distribution plant. Table 6-1 on Page 87 of the NARUC Manual shows the general classification of each of the distribution plant accounts into either a demand related or customer related component. More specifically, Part II of this Chapter, which starts on page 90 discusses various allocation techniques and calculations, begins as follows:

> *"When the utility installs distribution plant to provide service to a customer and to meet the individual customer's peak demand requirements, the utility must classify distribution plant data separately into demand- and customer-related costs."*

Nowhere in the NARUC Manual does a suggestion appear that the cost of electric distribution facilities should be classified or allocated on the basis of energy usage.

The Staff COSS suggests that because distribution facilities carry the "average" load of customers, costs should be allocated based on the average load or even the number of kWh that flow through the wires. This methodology unreasonably ignores the fact that the vast majority of the costs of the distribution system are not caused by its average use. If the system were designed to transport deliveries at only the average amount of electricity, or the amount of energy that is transported and delivered on an annual basis, it would be a much different

system. However, no responsible designer of an electric distribution system would ever design a system that would permit delivery of only the average daily or average annual use. Electric distribution system costs are incurred to serve the expected peak load or any particular circuit.

Q. Do you have particular concerns with the manner in which the Staff COSS methodology classifies and allocates the costs of particular electric distribution accounts?

A. Yes. These concerns are as follows:

Accounts E360 to E362, E365, E366, E367 and E368

These accounts include land, local distribution headquarters, substations, overhead conductors and devices, underground conduit, underground conductors and devices, and line transformers. Staff's COSS requires both the costs of this plant and the expenses associated with this plant to be separated into energy-related and demand-related components and allocated across the rate schedules using a kWh allocation for the energy-related portion and CP allocator for the demand costs, respectively. Staff's proposed classification and allocation ignores the fact that there is no relationship between the costs incurred for these plant items and the amount of energy consumed by various rate classes over an annual period.

Accounts C389 to C399 – Common Plant and E303 Intangible Plant

In Staff's COSS the plant and associated depreciation reserve booked to C389-C399 – Common Plant and to C303 – Intangible Plant associated with meter reading was separated into a customer related and demand related component. The allocation of the customer related portion is the same as the Company's methodology, but the demand related portion was allocated using the class non-coincident peak ("NCP") allocator.

The class NCP is a measure of the peak of each class of customers, regardless of when it occurs. Although used in past cost allocation studies by the Company, it is less accurate than

the use of both the actual CP and actual sum of individual customer demands. There is no reason to use an approximate substitute (the NCPs) when the real drivers (the CPs and sum of individual customer demands) are available. For these reasons, Staff's method of allocation of Common and Intangible Plant is unreasonable.

Accounts E902 – Meter Reading Expenses & E903 - Customer Records and Collection

Under the Staff COSS, expenses booked to these accounts are separated into a customer-related and demand-related component via a 50% - 50% split. Staff's 50% - 50% spilt between customer-related and demand-related components is not supported by any explanation or cost justification. Classifying basically fixed meter reading costs as demand-related for recovery through variable energy or demand charges violates the most fundamental cost classification and allocation principles. The amount of energy used has no bearing on the cost to read a meter. The majority of the time a meter reader spends is not the actual reading of the meter, but simply travelling from one meter to another. Itis independent of the type, size, or usage of the customers in that class. The variable that drives the total meter reading related costs booked to these accounts is the number of customers. Staff's classification of meter reading expenses as demand costs should be disregarded.

Subsequent Base Case Requirements

Q. Do you believe that the Company should be required to complete the Staff COSS in subsequent base rate case filings?

A. No. The Company is requesting that this requirement not be included for the filing of its next base rate case.

Q. Does this conclude your direct testimony?

A. Yes. It does.

APPENDIX E1 - DETAILED REVIEW OF COST OF SERVICE STUDY

Set forth below are details concerning the COSS Modeling Procedures as well as the functionalization and allocation of particular costs in the Company COSS.

Modeling Procedure

After expenses or plant investment-related costs have been entered into the COSS model, usually by FERC account or groups of accounts, one modeling allocator is also entered which performs two functions. The allocator shows:

1. Which of the six segments, or functions, the particular plant or expense item has been attributed to, and
2. The basis on which the particular plant or expense item has been allocated across the rate classes.

The COSS model starts the calculation procedure by allocating the respective plant and expense items to rate classes. Rate revenues for each rate class are then target balanced such that the resulting ROR for each of these rate classes achieves the Company's proposed overall ROR. The model continues by separating all plant and expense items into the appropriate functional segment by rate class, according to the modeling allocator assigned to the particular plant or expense item.

ALLOCATOR NAMING CONVENTION

For consistency and simplicity of bookkeeping, a naming convention has been developed for the modeling allocators.

Direct Allocators

All modeling allocators that end in a dash and a number (such as SUMPK@PRI-04) are direct allocators, meaning that they:

1. Allocate the plant or expense item based on an external constant as indicated by the name of the modeling allocator. For example, the "SUMPK@PRI " in the above allocator denotes the sum of all customers' greatest peak demands as observed at the primary lines, and
2. Segments, or functionalizes, the plant or expense item into one of the six segments as indicated by the trailing number. For example, the "-04" from the above allocator denotes the Local Delivery segment. The segment numbering method used in our analysis is as follows:
    - Segment #2 – Street Lighting
    - Segment #3 – Access
    - Segment #4 – Local Delivery
    - Segment #5 – System Delivery
    - Segment #6 – Customer Service
    - Segment #7 – Measurement

Note that segment #1 is not used.

Indirect Allocators

All modeling allocators that do not end in a dash and a number (such as A&GEXP) are indirect allocators, meaning that they will both segment and allocate costs in the same proportion as other individual or groups of plant or expense items. The names of these modeling allocators are an indication of the items upon which this process takes place. In this example, the A&GEXP allocator segments and allocates costs in the same proportion as the Administrative and General ("A&G") expenses in aggregate.

ALLOCATION DETAILS

Intangible Plant

Electric intangible plant (Accounts E301 to E303) was not included in the study.

Production Plant

There is no Production Plant on the Company's books.

Transmission Plant

All of transmission plant (Accounts E350 to E359) is excluded from the Cost of Service study as I have previously discussed since it is not related to the regulated electric distribution business.

Distribution Plant

The majority of Distribution Plant (Accounts E360 to E374) (Schedule SS-E5, pages 1-2, lines 9 to 20) have been functionalized as follows:

- Substations, poles, wires, circuits and transformers have been functionalized either to the Local Delivery or the System Delivery segments
- Electric services have been functionalized to the Access segment
- Meters to the Measurement segment
- All electric street lighting related equipment to the Street Lighting segment

After this functionalization was completed, each account was then examined to determine the proper allocation of the functionalized costs across rate classes. Investment segmented as Local Delivery was allocated consistent with the prior discussion, to the applicable rates based on the sum of the applicable customers' individual peak demands other than specific exceptions as noted.

Investment segmented to the System Delivery segment was allocated across the applicable rate schedules based on each applicable class's contribution to the coincident peak (also known as the CP). The details of the functionalization and allocation for each of the major Distribution Plant accounts are as follows:

E360 - Land & Land Rights

The investment in land or right-of-ways related to directly providing service to the few customers on Rate HTS-HV was directly assigned to this rate. The investment in this Account associated with substations follows the functionalization and allocation of the substations (recorded in Account E362 Station Equipment). The remaining investment in this account is attributed to local distribution headquarters, which follows the functionalization and allocation of all distribution plant in aggregate.

E361 - Structures and Improvements

The portion of investment in this account associated with substations follows the functionalization and allocation of Account E362 Station Equipment. The remaining portion is attributed to local distribution headquarters plant and follows the functionalization and allocation of all distribution plant in aggregate.

E362 - Station Equipment

Distribution investment in switching stations was segmented to the System Delivery segment and allocated to all customers served at 26 kV (on Rate HTS-sub) and the remainder of the load for primary and secondary customers based on their contribution to CP.

The distribution plant attributed to High Voltage substations (termed class H substations) was also segmented to the System Delivery segment. These substations convert either 69 kV, 138 kV or 230kV power directly to primary voltages (usually 13 kV). Since this type of substation only provides service to primary and secondary customers, the investment

was allocated across rates serving customers at primary and secondary voltages based on the CPs of these rate classes.

Plant recorded for all other substations, referred to as the subtransmission classes (A, B, D, and other classes of substations), were segmented to the System Delivery segment and allocated across the rate classes serving primary and secondary voltage customers based on the CPs of these rate classes.

E364 - Poles, Towers & Fixtures

Poles were first analyzed to determine their specific use. Those poles used for street lighting purposes were segmented to the Street Lighting segment and directly assigned to rates BPL and PSAL based upon the type of plant and number of each type being billed under each applicable rate. Although an analysis was performed to determine the portion of E364 directly related to providing service to customers on Rate HTS-HV, no assets were found.

The remaining pole investment was separated into three categories, based on its use, to deliver either secondary, primary and/or subtransmission voltages to customers. An analysis was performed utilizing the Graphic Information System ("GIS") facilities mapping system to determine the type and number of conductors attached to every distribution pole in the system.

The total investment in poles used to carry secondary voltage conductors was segmented to the Local Delivery segment and allocated to all secondary customers based upon the sum of individual secondary customer peak demands, consistent with the methodology previously explained. For pole configurations carrying conductors of several operating voltages, the appropriate secondary portion of the pole investment was segmented to the Local Delivery segment and allocated as stated above.

The portion of the investment in poles used to carry primary voltage conductors was segmented 50% to the Local Delivery segment and 50% to the System Delivery segment.

The plant segmented to the Local Delivery segment was allocated to all customers served at secondary or primary voltages based upon the sum of individual customer peak demands of these classes. Those investments segmented to the System Delivery segment were allocated to all customers served at secondary or primary voltages based on these classes' contribution to the system CP. To simplify modeling, a combined allocator named "PRIMARYLINES" was developed to perform this segmentation and allocation in one step.

Finally, the portion of the investment in poles used for carrying subtransmission voltage conductors was segmented 21.1% to the Local Delivery segment and 78.9% to the System Delivery segment, consistent with the methodology previously discussed. The subtransmission plant segmented to Local Delivery was directly assigned to Rate HTS-Subtransmission, while the investment segmented to System Delivery was allocated to customers served through non-Class H substations served at secondary, primary or subtransmission voltages based on these classes contribution to the system CP, consistent with the methodology previously discussed. Similar to what was done above, a combined allocator named "SUBTRANSLINES" was developed to perform this segmentation, assignment and allocation in one step.

E365 - Overhead Conductors and Devices

This account is comprised primarily of various types of wire and other overhead equipment of various plant types (i.e. #2 Al wire, #3 Al wire, 4kV single phase lighting arrestor, etc.).

The investment in conductors (wire) associated with dedicated street lighting poles (those used solely for street lighting) was first directly assigned to the Street Lighting segment in Rates PSAL or BPL based upon the number of overhead street lighting-only poles in each

rate class. This investment was estimated as the typical pole-to-pole length of secondary wire most commonly used for street lighting purposes for each of these street lighting poles.

The remaining equipment was first separated into the voltage class in which it is used - secondary, primary, subtransmission or high voltage and was then segmented and allocated in a method similar to that discussed above for poles. Investment in equipment whose normal operation voltage could not be determined or is used for all voltages (such as grounding wire) was allocated in the same proportion as the total of Account E365 equipment whose operating voltage could be determined.

The one exception to this method is the investment in conductors and other associated equipment used to serve customers on HTS-HV which was segmented to the Access segment since it effectively comprises the service drop to these customers. This investment was then directly assigned to this rate class. Although an analysis was performed to determine the portion of E365 directly related to providing service to customers on Rate HTS-HV, no assets were found.

E366 - Underground Conduit

These investments follow the functionalization and allocation of Account E367 underground Conductors and Devices.

E367 - Underground Conductors and Devices

A detailed segmentation and allocation was performed on a similar basis as done for investments booked to Account E365 - Overhead Conductors.

E368 - Line Transformers

Investments in line transformers were functionalized to the Local Delivery segment. The embedded costs of all line transformers in service were linked to the customers being served by each type and size of transformer. The average cost, in dollars per kVA, of

transformer capacity was multiplied by the sum of the peak demand of each customer class to arrive at a calculated total transformer investment by rate class. This value was then used as an allocator of booked transformer investment.

E369 - Services

Investment in electric services was first classified as either minimum or excess investment. This is done since the magnitude of the customer's use or peak demand in some cases requires the use of a larger size service wire. Since the increase in costs above that of the minimum sized service is driven by customer demands, they are more appropriately demand related costs. They are termed excess costs and are segmented to the Local Delivery Segment to be recovered through the rate component where other demand related costs are recovered. The minimum investment was determined for subsets of each rate class, as the installed cost of a service utilizing the minimum wire size installed for customers in that subclass. This portion was segmented to the Access Segment for recovery through the Service Charge. The subsets analyzed for Rate RS were comprised of the various type of housing stock, including single family detached, single family attached, two family, three to four family homes, five to nine family homes, and structures of ten or greater residential units. For the demand rates of GLP and LPL, the subsets were determined by electrical demand. The excess investment was determined as the additional cost, over the minimum cost, of the typical service utilizing the wire size most commonly installed for customers on each rate class subset.

E370 - Meters

Given that new AMI meters are relatively the same cost for customers in each rate class, the meter investment booked in FERC Account E370 was segmented to the Measurement segment and allocated across the rates based upon the relative installed cost of new meters.

E373 – Street Light and Signal Systems

The costs charged to this account include all street lighting luminaires, decorative street lighting poles, and miscellaneous devices such as shrouds and brackets. All costs related to street lighting luminaires and miscellaneous devices have been segmented to the Street Lighting segment and are directly assigned to the two street lighting Rate Schedules BPL and PSAL based upon the number and type of luminaires and other devices billed under each rate. Local municipalities are only charged for the luminaires used for public street lighting in overhead areas since the luminaires can be mounted on already existing distribution poles. Since this is not the case in declared underground zones, in order not to burden the municipality with the expense of the underground street lighting poles, standard underground poles have been provided at no charge. The investment related to these poles provided at no charge has been segmented and allocated in the same proportion as distribution plant excluding meters. The investment in poles for other than these purposes have been segmented to the Street Lighting Segment and directly assigned to the two street lighting Rate Schedules BPL and PSAL based upon the number and type of poles billed under each rate.

Asset Retirement Obligations

The amounts for Asset Retirement Obligations (or AROs) booked to Account E374 was found to be almost exclusively related to poles and towers booked to Account E364, thus were functionalized and allocated in the same proportion as performed for the plant in Account E364.

General, Common and Other Plant

An accounting code, or Business Code, associated with the actual gross plant balances indicating the department to which the plant is assigned was used to segment both the general

(Accounts E389 to E399) and common (Accounts C389 to C399) plant account items (Schedule SS-E5, page 1). Each Business Code was then grouped by function to be allocated based on cost causation. For example; a Description for office furniture and equipment was added to the Customer Service segment and allocated in the same proportion as all Customer Service activities. In other cases, where some of the facilities, such as vehicles, etc. used by the Customer Operations Department are shared between groups that are responsible for meter reading and those that provide general customer service (collections, phone inquiry, walk-in payment centers, etc.), these investments were further split in the Cost of Service Study between the Measurement segment and the Customer Service segment based on the proportion of work performed by each group. In general, all general and common investments were allocated to the rate schedules in the same proportion as the overall respective plant accounts for each segment. Items for which no reasonable functionalization could be determined were classified as "unassigned" and allocated in the same proportion as its associated plant account. In other words, unassigned general plant followed general plant and unassigned common plant followed common plant (general plant, common plant and other plant are shown on Schedule SS-E5, pages 11-12.

Depreciation Reserve

The depreciation reserve associated with each Account was segmented and allocated in the same proportion as its associated plant account (Schedule SS-E5, pages 15-18, lines 1 to 93).

Adjustments to Develop Rate Base

Adjustments to net plant used to develop Rate Base consist primarily of capital added since the end of the COS year, working capital and deferred taxes for the distribution utility.

Most capital additions used allocated based upon distribution plant with other additions allocated to total net plant. The capital rate base adjustment associated with the CEF-EC program were allocated based upon the underlying meter costs for the RS and GLP rate schedules. In addition, approximately $440M of distribution net plant additions associated with CEF-EC were reclassified into the CEF-EC adjustment, with a total CEF-EC adjustment of approximately $670 million. The underlying components of working capital were analyzed and segmented according to their individual use. Working capital requirements associated with Material and Supplies, Cash, Prepayments, and Working Funds were allocated and segmented in the same proportion as the sum of O&M and capital additions (essentially cash outlays) through the use of the allocator termed "EXPENDITURES." Deferred taxes were segmented and allocated in proportion to the related plant values. These adjustments are indicated in Schedule SS-E5, pages 19-20, lines 1 to 36.

Operating Revenues

The values indicated in Schedule SS-E5, pages 3-4, line 56 entitled "Rate Revenue from Customers" are the portion of the total target balanced revenue requirements necessary to be recovered from rate-related revenues (from service charges, distribution charges, minimum charges, etc.) at the proposed overall ROR, plus the increase in non-rate-related revenues. The effects of other non-rate-related revenues are booked to Accounts E450 to E456 and are shown in Schedule SS-E5, pages 21-22, lines 10 to 11.

Production Expenses

Similar to the production plant items, there are no production expenses (Accounts E500 to E557) remaining on the Company's books.

Transmission O&M Expenses

Similar to Transmission Plant, these items were excluded from the Cost of Service study.

Distribution O&M Expenses

O&M expenses (Accounts E580 to E598) were generally segmented and allocated in the same proportion as their associated plant account(s) (Schedule SS-E5, page 23-24, lines 14 to 48).

Customer Accounts, Service and Sales Expense

Expenses from a wide range of customer contact activities are booked to Accounts E901 to E916. A separate analysis was performed on the costs charged to each of these accounts to determine the best functionalization fit. The details of this account-by-account functionalization can be found on Schedule SS-E5, pages 25-28, lines 59 to 109. The costs in each of these accounts related to meter reading were segmented to the Measurement segment and allocated on the basis of the costs to read meters for each rate class. The portion related to billing was segmented to the Customer Service segment and allocated on the relative costs of billing by rate class. The portion related to account maintenance activities (including answering general questions, setting up new accounts, remittance processing, and collection activities) was segmented to the Customer Service segment and allocated on the relative costs of performing these activities by rate class. The portion of these expenses related to general regulated utility responsibilities was segmented to the Local Delivery segment and allocated on the relative costs of performing these activities by rate class. The portion of Customer Records and Collection costs (Account E903 and E905) associated with costs to disconnect

customers for non-payment of bills (and their eventual reconnection) were segmented to the Customer Service segment and allocated based upon the number of customers.

Where Customer Accounts expenses are recovered through the Societal Benefits Charge ("SBC"), such expenses were excluded from the Cost of Service study as indicated in Schedule SS-E3.

Administrative and General ("A&G") Expenses

These expenses (Accounts E920-935) include an eclectic mix of types of expenditures, which were analyzed separately to determine the best functionalization fit. The details of this item-by-item functionalization can be found on Schedule SS-E5, pages 27-28, lines 115 to 127.

Depreciation and Amortization Expenses

All depreciation and amortization expenses were segmented and allocated in the same proportion as their associated plant accounts (Schedule SS-E5, pages 29-30, lines 1 to 29).

Pro Forma Expense Adjustments

The pro forma adjustments the Company is proposing are summarized in Schedule MPM-29 and detailed as Adjustments #1 to #24 in Schedules MPM-30 through MPM 53of Mr. McFadden's direct testimony in this proceeding. With the exception of the pro forma adjustments discussed below, the balance of the adjustments related to electric distribution are included in the Cost of Service Study (Schedule SS-E5, pages 31-32, lines 11 to 45)

Each pro forma adjustment included in the Cost of Service Study was segmented and allocated in the same proportion as the associated plant or O&M account(s). The Cost of Service modeling of Pro-Forma #3 associated with Interest Synchronization, Pro-Forma #5 associated with Electric COLI Interest Expense, and Pro-Forma #7 associated with Gains and

Losses on Sales of Property all include the added income tax effects on revenue requirements as an additional expense.

Pro-Forma #6 associated with Weather Normalization, Pro-Forma #15 associated with Energy Strong II/IAP, Pro-Forma #19 associated with CEF-CE, Pro-Forma #21 associated with CIP, and Pro-Forma #22 associated with TAC are excluded from the Cost of Service Study (Schedule SS-E5) since these adjustments would be classified as revenue adjustments and do not impact distribution costs.

Taxes

All Taxes and Tax Deductions were segmented and allocated in the same proportion as their associated plant or O&M account(s). Details of these allocations are indicated on Page 35-44of Schedule SS-E5.

CREDENTIALS
OF
STEPHEN SWETZ
SR. DIRECTOR-CORPORATE RATES AND REVENUE REQUIREMENTS

My name is Stephen Swetz and I am employed by PSEG Services Corporation. I am the Sr. Director - Corporate Rates and Revenue Requirements where my main responsibility is to contribute to the development and implementation of electric and gas rates for Public Service Electric and Gas Company (PSE&G, the Company).

WORK EXPERIENCE

I have over 30 years of experience in Rates, Financial Analysis and Operations for three Fortune 500 companies. Since 1991, I have worked in various positions within PSEG. I have spent most of my career contributing to the development and implementation of PSE&G electric and gas rates, revenue requirements, pricing and corporate planning with over 20 years of direct experience in Northeastern retail and wholesale electric and gas markets.

As Sr. Director of the Corporate Rates and Revenue Requirements department, I have submitted pre-filed direct cost recovery testimony as well as oral testimony to the New Jersey Board of Public Utilities and the New Jersey Office of Administrative Law for base rate cases, as well as a number of clauses including infrastructure investments, renewable energy, and energy efficiency programs. A list of my prior testimonies can be found on pages 3 and 4 of this document. I have also

contributed to other filings including unbundling electric rates and Off-Tariff Rate Agreements. I have had a leadership role in various economic analyses, asset valuations, rate design, pricing efforts and cost of service studies.

I am an active member of the American Gas Association's Rate and Strategic Issues Committee, the Edison Electric Institute's Rates and Regulatory Affairs Committee and the New Jersey Utility Association (NJUA) Finance and Regulatory Committee.

EDUCATIONAL BACKGROUND

I hold a B.S. in Mechanical Engineering from Worcester Polytechnic Institute and an MBA from Fairleigh Dickinson University.

Notes:
1 Agreed upon in Settlement
2 Move toward cost limited at no decrease from current service charge and no increase greater than 1.5 times the overall average distribution % increase.
3 Access and Customer Service Rev Req per total GLP Customer plus Measurement Rev Req divided by the number of metered customers divided by 12; limits the same as Note 2
4 Access and Customer Service Rev Req per total GLP Customer divided by 12; limits the same as Note 2
5 Calculated at the GLP Access Segment per customer plus the GLP Customer Service Segment Revenue Requirements per customer plus the LPL-P Measurement Segment per customer divided by 12; limits the same as Note 2

Electric Proof of Revenue by Rate Schedule
Explanation of Format

The summary and each rate schedule provide the details of 1) a) Actual and b) Weather Normalized and also 2) a) Annualized Weather Normalized (all customers assumed to be on BGS and revenue based on current tariff rates) and b) the proposed rate design.

1) Actual and Weather Normalized

All the components are separated into Delivery and Supply. In addition to the Distribution components of Delivery, also included in the schedule are lines for Societal Benefits Charge, Non-Utility Generation Charge, Zero Emission Certificate Recovery Charge, Solar Pilot Recovery Charge, Green Programs Recovery Charge, Conservation Incentive Program, Tax Adjustment Credit, CIEP Standby Fee (as applicable), Facilities Charges, Miscellaneous items, Minimums, and Unbilled Revenue. The first column shows the actual billing units for the test year from Schedule SS-E2. The second column shows annual average rates (without Sales and Use Tax, SUT) occurring during the test period. The third column presents annualized revenue for the test period. The fourth column shows the weather normalized billing units for the test year from SS-E2. The fifth column shows the applicable rates. Column 6 presents weather normalized revenue. Columns 7 and 8 show the differential revenue, in thousands of dollars and percent increase, respectively, for each of the billing unit blocks.

2) Annualized Weather Normalized (all customers assumed to be on BGS) and the Proposed rate design.

All the components are separated into Delivery and Supply. In addition to the Distribution components of Delivery, also included in the schedule are lines for Societal Benefits Charge, Non-Utility Generation Charge, Securitization Transition Charges, Solar Pilot Recovery Charge, CIEP Standby Fee (as applicable), Green Programs Recovery Charge, Tax Adjustment Credit, Green Enabling Mechanism, Facilities Charges, Miscellaneous items, Minimums, and Unbilled Revenue. The first column shows the annualized weather normalized billing units for the test year from Schedule SS-E2. The second column shows present Delivery rates (without Sales and Use Tax, SUT) effective November 1, 2023. The Supply-BGS rates in the second column reflect the rates in effect November 1, 2023 and for CIEP energy, reflect the latest available 12-month class average hourly rates. The third column presents annualized revenue for the test period assuming all customers are provided service under their applicable BGS provision. The fourth column repeats the billing units of the first column. The fifth column shows the proposed rates that result in the proposed revenues shown in column 6. Columns 7 and 8 show the proposed revenue increase, in thousands of dollars and percent increase, respectively, for each of the billing unit blocks.

TYPICAL RESIDENTIAL ELECTRIC BILL IMPACTS

The effect of the proposed changes in the Rate Case 2023 (RC 2023) on typical residential Electric bills, if approved by the Board, is illustrated below:

Residential Electric Service - Average Monthly Bill				
If Your Average Monthly kWhr Use Is:	Then Your Present Monthly Bill (1) Would Be:	And Your Proposed Monthly Bill (2) Would Be:	Your Monthly Bill Change Would Be:	And Your Percent Change Would Be:
137	$32.00	$37.31	$5.31	16.59 %
275	59.21	66.72	7.51	12.68
548	113.64	125.55	11.91	10.48
650	134.25	147.74	13.49	10.05
1,000	205.89	225.43	19.54	9.49

(1) Based upon current Basic Generation Service Residential Small Commercial Pricing (BGS-RSCP) and Delivery Rates in effect November 1, 2023, and assumes that the customer receives BGS-RSCP service from Public Service.

(2) Same as (1) except includes increase in the RC 2023.

Residential Electric Service - Monthly Summer Bill				
If Your Monthly Summer kWhr Use Is:	Then Your Present Monthly Summer Bill (3) Would Be:	And Your Proposed Monthly Summer Bill (4) Would Be:	Your Monthly Summer Bill Change Would Be:	And Your Percent Change Would Be:
171	$39.69	$47.60	$7.91	19.93 %
342	74.43	87.15	12.72	17.09
683	144.87	167.18	22.31	15.40
803	170.89	196.57	25.68	15.03
1,300	278.76	318.42	39.66	14.23

(3) Based upon current Basic Generation Service Residential Small Commercial Pricing (BGS-RSCP) and Delivery Rates in effect November 1, 2023, and assumes that the customer receives BGS-RSCP service from Public Service.

(4) Same as (3) except includes increase in the RC 2023.

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
STEPHEN SWETZ
SENIOR DIRECTOR – CORPORATE RATES AND REVENUE REQUIREMENTS
ON
GAS COST OF SERVICE AND RATE DESIGN

Q. Please state your name, affiliation and business address.

A. My name is Stephen Swetz, and I am the Senior Director – Corporate Rates and Revenue Requirements for PSEG Services Corporation. My principal place of business is 80 Park Plaza, Newark, New Jersey 07102. My credentials are set forth in the attached Schedule SS-G1.

Q. Please describe your responsibilities as Senior Director - Corporate Rates and Revenue Requirements.

A. In this position I have, among other things, responsibility for the development of rates and tariffs for Public Service Electric and Gas Company ("PSE&G" or "Company").

Q. Have you previously testified in proceedings before the New Jersey Board of Public Utilities ("Board" or "BPU")?

A. Yes. I have both submitted written testimony and testified live before the BPU in a number of proceedings that are identified in Schedule SS-G1.

SCOPE OF TESTIMONY

Q. What is the purpose of your direct testimony in this proceeding?

A. The purpose of my direct testimony is to support the Company's proposed changes to its rates for Gas Service, which are designed to recover the revenue requirements for the gas distribution business as presented in this filing. My testimony provides the Company's embedded cost of service study ("Company COSS") used as the basis for development of the new gas rates and the proposed rate design for each rate schedule in PSE&G's Gas Tariff. I also present an

alternative embedded cost of service study ("the Staff COSS") as required under the 2018 Rate Case Order and explain why that COSS should not be used to set rates in this case.[1]

Additionally, I sponsor other studies and modifications to the Company's Tariff for Gas Service ("Tariff") including the following:

- Recovering Gas Bad Debt Costs consistent with method used in electric business; and
- The establishment of a Storm Recovery Charge ("SRC") to recover major storm costs as a component of a proposed Distribution Adjustment Charge ("DAC") that was previously proposed as part of the COVID-19 cost recovery proceeding;[2]
- Tax Adjustment Credit ("TAC") modifications.

I also sponsor the Company's proposed Tariff, which is attached to the Company's Petition in Exhibit P-1 as Schedule 3.

[1] *I/M/O the Petition of Public Service Electric and Gas Company for Approval of an Increase in Electric and Gas Rates and for Changes in Tariffs for Electric and Gas Service, B.P.U.N.J. No. 16 Electric and B.P.U.N.J. No. 16 Gas, and for Changes in Depreciation Rates, Pursuant to N.J.S.A. 48:2-18, N.J.S.A 48:2-21 and N.J.S.A. 48:2-21.1, and for Other Appropriate Relief*, BPU Docket Nos. ER18010029 & GR18010030; *I/M/O the New Jersey Board of Public Utilities' Consideration of the Tax Cuts and Jobs Act of 2017*; BPU Docket No. AX18010001; *I/M/O Public Service Electric and Gas Company for Approval of Revised Rates (Effective on an Interim Basis April 1, 2018) to Reflect the Reduction Under the Tax Cuts and Jobs Act of 2017*, BPU Docket No. ER18030231, Decision and Order Adopting Initial Decision and Stipulation (October 29, 2018) (the "2018 Rate Case Order"), paragraph 25.

[2] *I/M/O the New Jersey Board of Public Utilities Response to the COVID-19 Pandemic*, BPU Docket No. AO20060471, PSE&G filing titled *I/M/O the Petition of Public Service Electric and Gas Company for Approval of Incremental COVID-19 Costs for Recovery Through a New Special-Purpose Clause, and for Authorization to Recover Uncollectible Costs for Gas Through the Societal Benefits Charge* (July 17, 2023).

Q. Do you sponsor any schedules as part of your direct testimony?

A. Yes. I sponsor the following schedules that were prepared and/or compiled by me or under my direction and supervision:

SCHEDULE DESCRIPTION	NUMBER
Qualifications of Stephen Swetz	SS-G1
Basis of Calculations Schedules	
Actual and Weather Normalized Billing Determinants	SS-G2
COSS Adjustments	SS-G3
Cost of Service Schedules	
Details of Complete COSS	SS-G4
COSS Summary Report by Functional Segment	SS-G5
COSS Revenue Requirements by Rate and Function	SS-G6
Sync with Rate Design	SS-G7
Rate and Rate Design Schedules	
Inter Class Revenue Increase Allocations	SS-G8
Service Charge Calculations	SS-G9
BGSS Calculations	SS-G10
Proof of Revenue by Rate Schedule	SS-G11
Typical Customer Bill Impacts by Rate Schedule	SS-G12
Staff's Cost Allocation Methodology Related Schedules	
Details of Complete COSS – Staff's Method	SS-G13
Summary Report – by Functional Segment – Staff's Method	SS-G14

Societal Benefits Charge ("SBC") Schedules

SBC Social Programs Rate Balance and Calculations.....SS-SBC-1-2

OVERVIEW OF THE COMPANY'S RATE FILING AND BASIS OF CALCULATIONS AND ANALYSIS

Overview

Q. What terminology does your direct testimony use regarding revenue and rates?

A. Throughout this testimony, the revenue or percentage increase for "Distribution" is based only on revenue from the Service Charge and Distribution Charge(s) for the particular rate schedule. The term "Delivery" refers to revenue from the Service Charge and Distribution Charges as indicated on the particular rate schedule, plus the revenue from the Balancing Charge and all of the applicable adjustment clauses. The "Total Bill" equals the Delivery Charges plus gas supply, and is calculated as if all customers were supplied on Basic Gas Supply Service ("BGSS").

Q. Please describe the gas distribution services provided by the Company.

A. The Company provides gas distribution services under the following Rate Schedules:

(i) Rate Schedule RSG sets forth the terms at which the Company provides firm delivery service for residential purposes;

(ii) Rate Schedule GSG sets forth the terms at which the Company provides firm delivery service to customers that do not qualify for Rate Schedule RSG and whose usage does not exceed 3,000 therms in any month;

(iii) Rate Schedule LVG sets forth the terms at which the Company provides firm delivery service for general purposes;

(iv) Rate Schedule SLG sets forth the terms at which the Company provides firm delivery service for gas street lighting purposes as well as lamp posts and maintenance;

(v) Rate Schedule TSG-F is a closed service that was available to customers who purchased or committed to purchase service prior to December 1, 1994 and whose maximum request for firm gas is not less than 150 therms per hour;

(vi) Rate Schedule TSG-NF sets forth the terms at which the Company provides interruptible delivery service to customers whose maximum request for gas is not less than a 150 therms per hour; and

(vii) Rate Schedule CIG is a closed interruptible service that was available to cogeneration customers who purchased or committed to purchase service prior to January 9, 2002.

(viii) Rate Schedule CSG is a firm or interruptible delivery service for general purposes where the customer is requesting a discount rate from a Public Service Rate Schedule for delivery service based on an (a) Economically Viable Bypass alternative or (b) Other Considerations.

Q. Please provide an overview of the Company's filing in this proceeding.

A. As described more fully by Company witness Mr. Michael McFadden's, PSE&G is seeking to increase its base delivery rates effective September 1, 2024 by approximately $422.8 million annually for its gas distribution business. As discussed further by Mr. McFadden and Company witness Mr. Cliff Pardo, the Company further proposes to make certain modifications to the Company's TAC, including flowing back Mixed Service deductions to customers. This change will reduce gas rates by approximately $102.0 million annually. In addition, the Company is

proposing the SRC to recover major storm costs, increasing gas rates by approximately $1.3 million annually. Finally, the Company is proposing to recover it gas bad debt costs through a new Social Programs component of the SBC for approximately $42.0 million. My testimony provides support on how these changes will impact rates.

Q. **How have Gas distribution charges changed since the 2018 base rate case?**

A. Gas distribution charges have increased at a compound annual growth rate ("CAGR") of 4.3% as shown in Figure 1. This increase is primarily driven by work to modernize the Gas system and replace cast iron and unprotected steel mains, which provide both a reliability and carbon emissions benefit to customers. Despite the considerable investment to modernize the gas system, the distribution charge CAGR for a residential customer using 1,000 therms per year is less than half of the statewide average of 10.6%. PSE&G's charges have increased considerably less than the New Jersey average because PSE&G has been able to control costs and maximize the value of its prior investments.

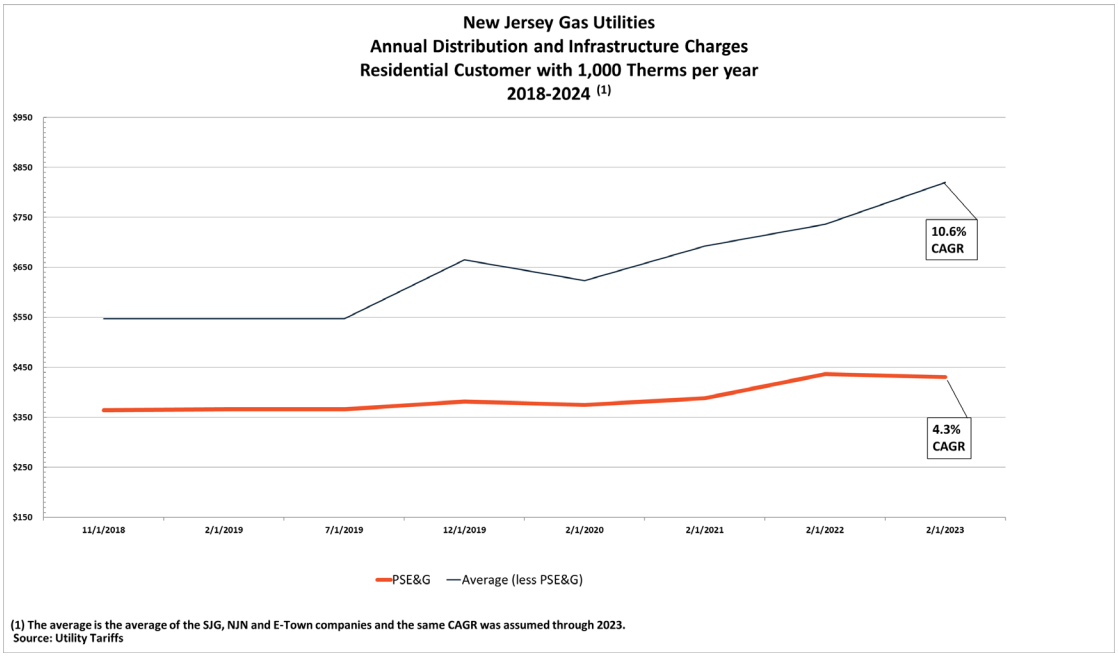

Figure 1

Q. **That shows that PSE&G's Distribution charges are lower than average, but how does PSE&G compare on a total bill basis?**

A. PSE&G continues to be lower than the average compared to its peers. In New Jersey, PSE&G remains on the lower cost side compared to of all of its peers in terms of the total gas and electric bill. Further, as shown in Figure 2 below, the Company has the lowest monthly gas bill amongst all of its peers – almost 27% lower than the average, as set forth in Figure 2 below.

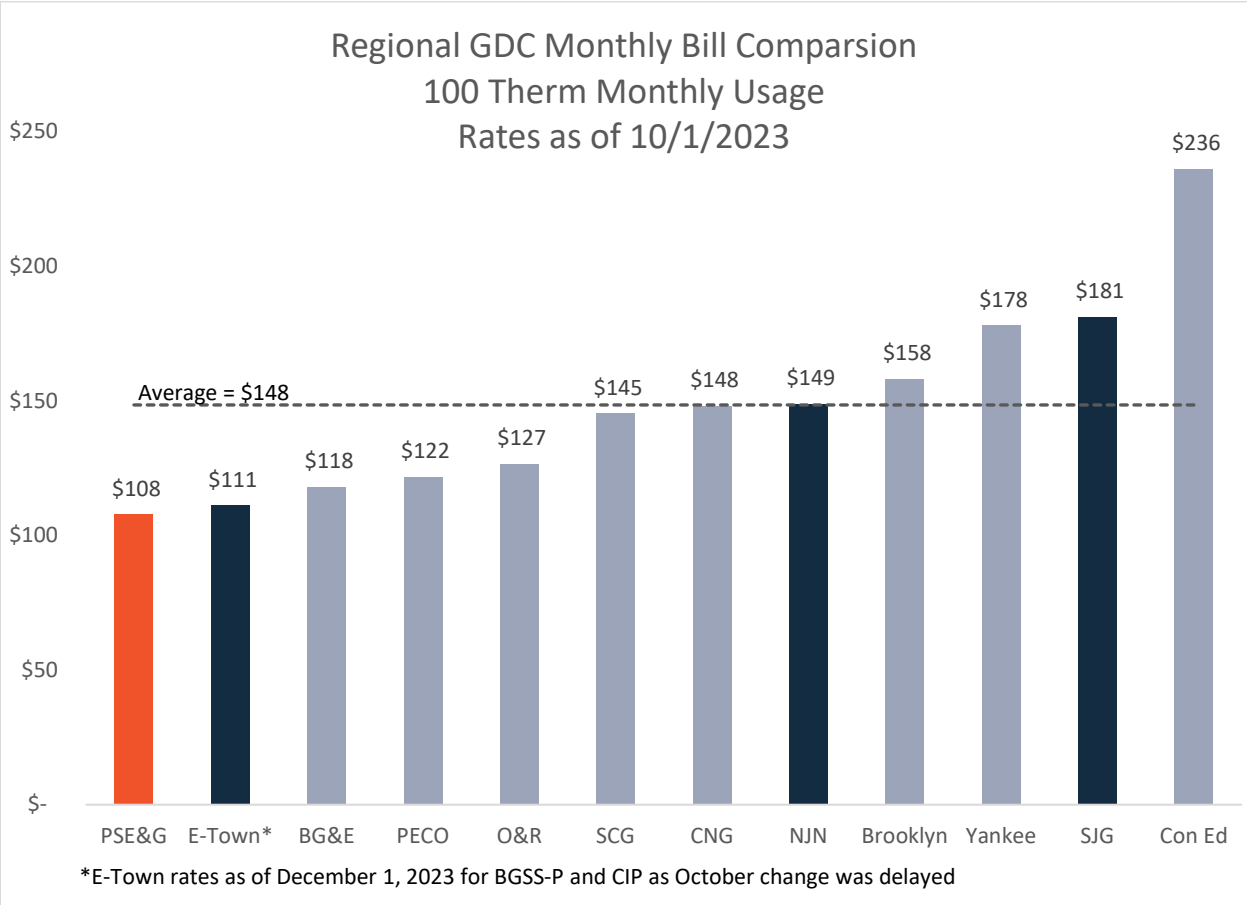

Figure 2

Q. How long has it been since PSE&G's last base rate case?

A. PSE&G filed its last base rate case on January 12, 2018, with new rates effective November 1, 2018. Since that time, every other NJ gas utility has filed at least two base rate cases.

Q. Why has PSE&G not filed a rate case until now?

A. As discussed in more detail below, this is primarily due to the Company's efforts to control costs. PSE&G takes very seriously its responsibility to customers to manage costs prudently and be good stewards of the gas distribution system and the customer funds needed to operate and maintain it effectively. This is achieved by regularly benchmarking Company costs and employee performance and creating appropriate employee incentives to continue to improve upon historic success.

Q. Please describe the efforts the Company has undertaken to protect lower-income customers from the impact of rate increases.

A. The Company is very focused on this vulnerable segment of our customer base. PSE&G's Energy Efficiency programs include incentives targeted to its lower income customers, with specific opportunities for both low and moderate income customers, who often face the highest energy burdens. The Company specifically seeks to provide energy savings opportunities to these customers in order to lower their energy burdens, as participants in the EE programs are expected to benefit from long term energy and bill savings, as well as health and safety improvements. The Company implements the State's Comfort Partners program to customers with incomes up to 250% of the Federal Poverty Level; that program provides free comprehensive energy savings solutions as well as upgrades to address health and safety problems in the home. PSE&G also recently filed its updated Clean Energy Future – Energy Efficiency II Program, which proposes to transfer administration of the Comfort Partners program to the Company in order further reduce market confusion and streamline the process for lower-income customers to take advantage of energy efficiency programs;[3] PSE&G believes this change in administration of the Comfort

[3] *I/M/O The Petition of Public Electric and Gas Company for Approval of its Clean Energy Future-Energy Efficiency II (CEF-EE I) Program on A Regulated Basis*, BPU Docket No. QO23120874 (filed December 1, 2023).

Partners program will significantly improve customer access to energy efficiency and allow the Company more flexibility in serving the needs of lower-income customers. Also as part of the Clean Energy Future – Energy Efficiency II Program, PSE&G proposed to continue to target low and moderate income customers by providing comprehensive energy assessments and free direct install of energy efficient measures and services to income qualified households with higher incentives and opportunities for no-interest financing for health and safety improvements to these customers (the Comfort Partners program does not include financing, as all measures are paid for by the program and free to eligible customers), and to continue to provide enhanced opportunities for customers in overburdened communities. PSE&G also offers higher incentives for high efficiency heating and cooling systems and continues to provide financial incentives to both property owners and tenants to install high efficiency equipment in apartments and other multifamily properties. The Company promotes the use of these programs to our customers through bill inserts and community outreach, conducting this communication in multiple languages where possible and appropriate.

Q. Are there other assistance programs for lower-income customers outside of PSE&G's energy efficiency programs, and if so, please describe those programs and who is eligible.

A. The Company also advocates at the State and Federal level for various grants provided to lower-income customers, including the Low-Income Home Energy Assistance Program ("LIHEAP"), Lifeline and Tenants Lifeline Program ("Lifeline"), and the Universal Service Fund ("USF"). LIHEAP is a Federal Block Grant program that helps low-income individuals and households pay for their winter heating bills, medically necessary cooling benefits, and weatherization. The Lifeline Program helps customers pay their utility bills with a $225 annual utility credit. To be eligible, a customer must be at least age 65, or at least age 18 and collecting

Social Security Disability. In addition, a single person must make less than $42,000, or a couple less than $49,000 annually. USF is a statewide program administered by the Department of Community Affairs that allows program recipients to pay no more than 3% of their income for electric and 3% for natural gas, or 6% for total electric, including electric heating for customers at or below 60% of the State median income. PAGE is a program for customers earning up to 500% of the Federal Poverty Limits and offers a grant of up to $700 per utility service. NJ SHARES is for customers earning up to 400% of the Federal Poverty Limit and is funded by customer donations which are matched by PSE&G.

PSE&G has more customers eligible for these low-income programs on a proportionate basis compared with other New Jersey utilities. This customer segment receives special focus.

Q. Are there steps PSE&G has taken during the COVID-19 pandemic to help these customers?

A. Yes. PSE&G, its customers, and New Jersey have faced unprecedented challenges as a result of the COVID-19 global pandemic that created difficult economic circumstances. In response to these challenges, PSE&G developed a comprehensive payment assistance outreach plan utilizing employees and contractors and conducted an external media campaign designed to provide customers opportunities to garner financial assistance and enter into deferred payment arrangements to avoid shut off.

Q. Has the Company considered the impact of gas rates on these customers?

A. Yes. As illustrated in the figure below, the relative cost of PSE&G's services to a typical combined (that is, electric and gas) residential lower-income customer has dropped significantly since 2009 and is essentially flat as compared with rates following the conclusion of the Company's 2018 base rate case.

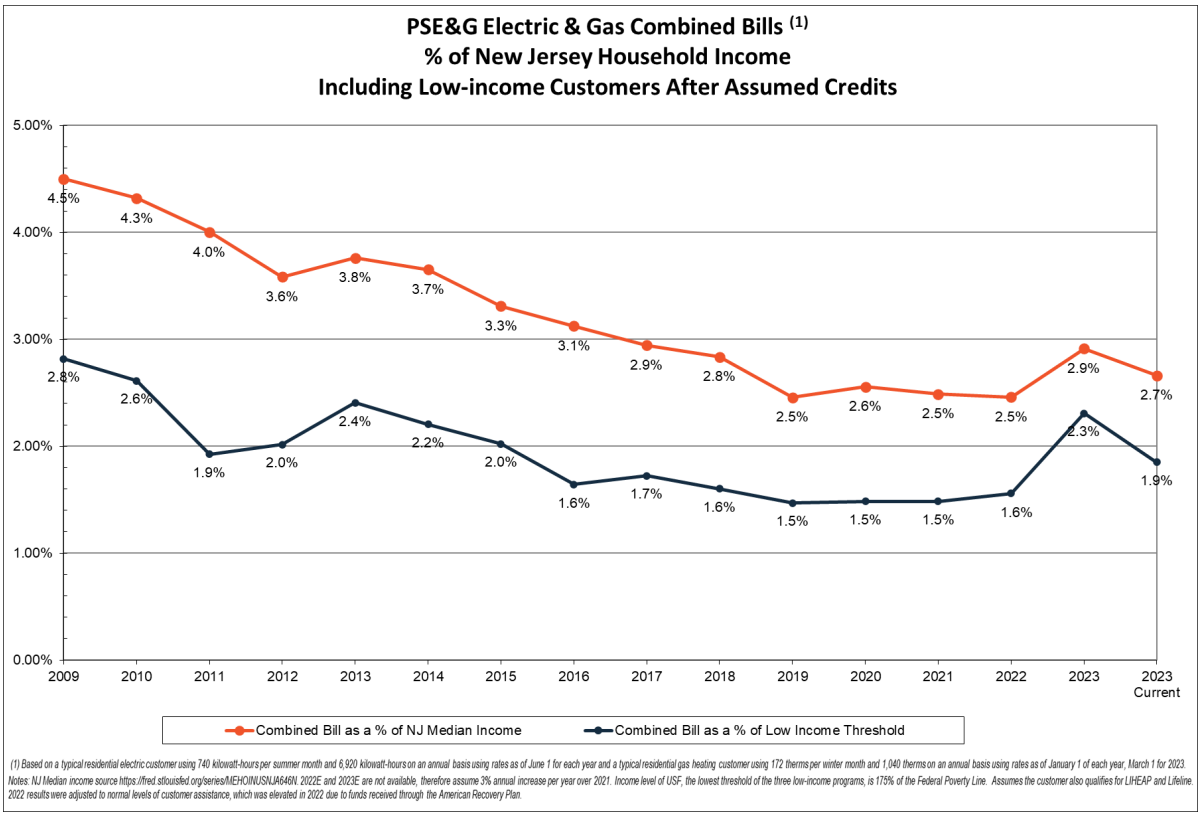

Figure 3

This chart compares the bill as a percentage of income for a typical combined electric and gas residential customer relative to New Jersey's median income and relative to the income threshold below which customers are considered low-income. As can be seen, for the average residential customer, the cost of service is less than 3% of median income. For lower-income customers, the cost of the bill after LIHEAP, USF, and Lifeline grants relative to an income level of 60% of State median income (the level at which a customer is eligible for these grants), is around 2% today. So, even with this proposed rate increase, the cost of electricity and gas for all of the Company's customers, including low-income customers, remains a very small portion of overall income for those able to take advantage of these programs.

Q. How does the current RSG Service Charge compare to other utilities?

A. As shown in the figure below, PSE&G's monthly RSG gas service charge is the lowest compared to similar gas utilities in the region.

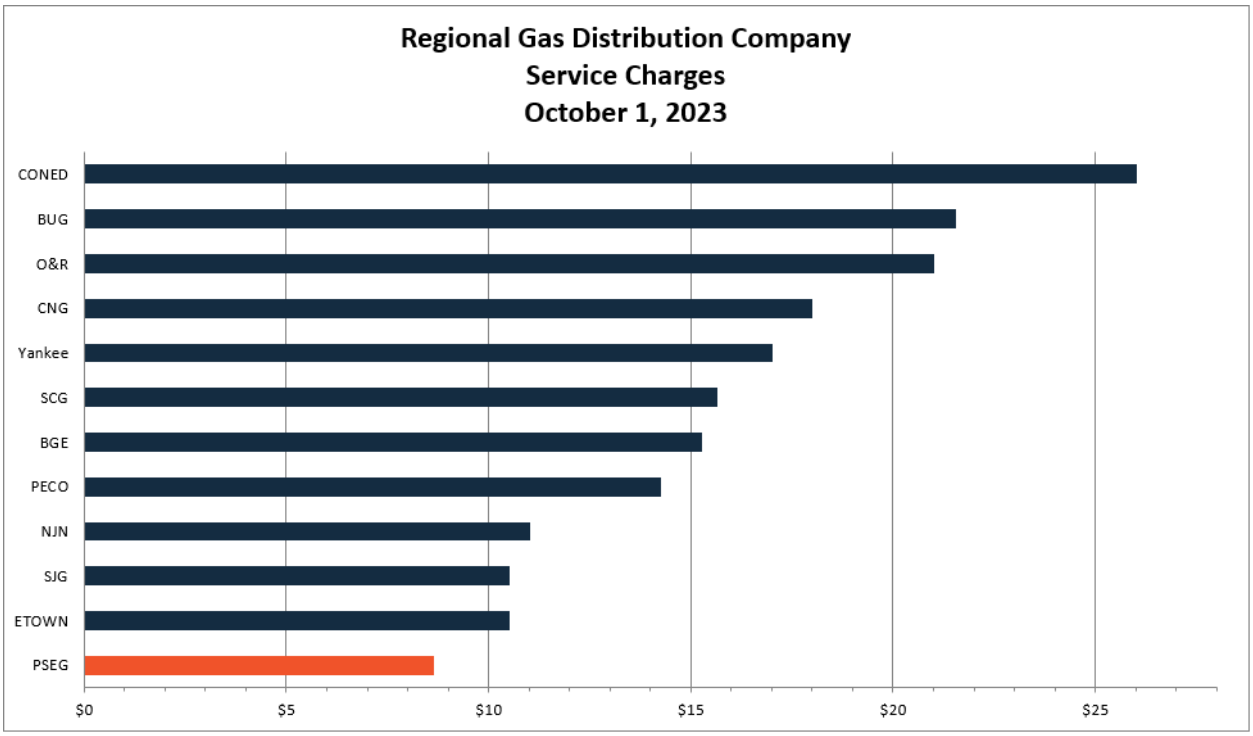

Figure 4

Q. What are the periods used for the COSSs and Rate Design that you are sponsoring in this proceeding?

A. The COSSs presented in this testimony are based upon the period of January 1 to December 31, 2022. The only variations from actual costs in the COSS period were the requested overall Rate of Return value, proposed rate base adjustments such as working capital requirements, and the proposed *pro forma* Adjustments. These adjustments, as well as the adjustments needed to synchronize the COSS results with the proposed rate design as discussed later in my testimony, and the rate design presented in this testimony are based upon the Test Year of June 1, 2023 through May 31, 2024 (hereafter "Test Year").

Q. What billing determinants will be used to determine the revenue requirement and rates that are being established in this proceeding?

A. The billing determinants used to establish rates and the revenue requirement in this proceeding will be the actual Test Year billing determinants as adjusted for normal weather. For the initial filing and any updates (prior to the final filing) with all actual data, the billing determinants will be a mix of weather normalized actual and forecasted billing determinants. Weather normalized billing determinants are calculated by adjusting actual recorded monthly gas sales to account for the effects of abnormal weather. A summary of the actual billing determinants, the weather normalized billing determinants, and the variation of each determinant from normal for the Test Year is shown in Schedule SS-G2.

Weather Normalization of Billing Determinants

Q. What weather pattern is used to weather normalize actual billing determinants?

A. The Company utilizes a twenty-year weather pattern as measured at Newark Liberty International Airport covering the period ended December 31, 2021.

Scope of the COSS

Q. Please describe the COSSs that the Company is presenting in this proceeding.

A. The Company is presenting two COSSs in this proceeding -- its recommended COSS is referred to as the "Company COSS" – and an additional COSS based on a methodology developed by BPU Staff. As discussed more fully below, the Company does not support the use of the Staff COSS to establish rates in this proceeding, but is submitting the study in compliance with the 2018 Rate Case Order. The COSSs discussed in this testimony are for the gas Distribution portion of the Company's operations. Thus the COSSs are generally "pipes only" analyses for the Company's regulated gas delivery business. They do not include the costs for the Company's

Balancing Services or BGSS because rates for those services are set in another proceeding. The impact of changes in distribution margin revenues that flow to the BGSS provider, such as those associated with Rate Schedule TSG-F, will, however, be shown as a change in the BGSS charges to customers.

Adjustments to Accounting Data

Q. Did you make any adjustments to the accounting data used in the COSSs?

A. Several adjustments to the 2022 accounting data used in the COSSs were necessary prior to its use. These adjustments and FERC Accounts associated with each of these adjustments are shown on Page 1 of Schedule SS-G3.

In the rate design process, the unit charges associated with these adjustments will be added back as appropriate in each rate schedule to assure full recovery of these expenses. The Company COSS and the Staff COSS each include these adjustments to costs and billing determinants.

COSS OVERVIEW

Introduction

Q. What is the first step in developing new gas rates?

A. The first step in developing new gas rates is the preparation of an appropriate COSS. The Company COSS was used to both separate costs by functional segments and to allocate these segmented costs to the rate classes or sub-classes based upon each class's responsibility for that cost.

Q. What is the objective of a COSS?

A. The objective of a COSS is to measure the cost responsibility of each rate class and distribution function (functionalization).

Cost Allocation Concepts

Q. Please describe the cost allocation concepts used in the Company's COSS.

A. Inherent in any COSS is the allocation to rate classes of many costs which by their nature are difficult to relate precisely to cost causation. Cost causation describes the cause and effect relationship between customer requirements, load profile, and usage characteristics, and the costs incurred by the utility to serve those requirements. Experts will differ on the best way in which many costs should be allocated among customer classes. The key is to determine which approach makes the most sense in terms of best answering the question of what caused the cost, and then to apply the result in a reasoned, balanced manner. At all times, it is important to recognize that the COSS is intended to be a guide to appropriate ratemaking, and that one objective of ratemaking is that the end result should be a reasonable one.

As I will discuss later, I have used the results from the Company COSS as a direct guide in developing rates but tempered the final rate design to provide a reasonable balance between the goal of moving each rate schedule towards costs and the goal of achieving reasonable percentage increases based upon the resulting customer impacts.

General Cost Allocation and Functionalization Methodology

Q. What is the basis for the cost allocation and functionalization methodologies used in the Company COSS?

A. In the gas distribution business, the revenue requirements related to gas mains and services far exceed all other items. Together these facilities comprise the vast majority of rate base and are the basis for much of the operations and maintenance ("O&M") expenses. As previously stated, it is important to ensure that the allocation methods used in the COSS reflect the underlying cost causation principles. Gas mains have been, and continue to be, installed to bring gas service to the

proximity of each customer's premise and are sized to handle the peak hourly gas flow at design conditions, without regard to the gas flow at any other time of day or season. These are the sole reasons and engineering basis for the design and cost of mains, and as such, the allocation of those costs should properly reflect each rate class's responsibility for the peak gas flow. Company witnesses Mike Schmid and Rick Fonseca discusses this in detail in the portion of their testimony entitled "Gas Capital Expenditures". In contrast to the cost of gas mains, the cost of a gas service (the pipe from the gas main to an individual building) is related to both the peak design loads of each building and the distance from the gas main (usually located in the street) to the structure itself. Because often one gas service serves more than one customer (or meter) in a building, the cost responsibility of a customer is a complex combination of site-specific conditions. The Company has relied on a study of actual installations of services and meters and employed that study to determine the allocation of gas service costs.

The methods of allocating the costs of mains and services used in the Company's COSS are based on sound cost causation principles and, as such, constitute a reasonable cost allocation methodology for the most significant categories of the Company's costs.

Functionalization into Five Segments

Q. What is the first step in the process to start a COSS?

A. As a first step in that process, the COSS unbundles total costs into five distinct functional segments – Distribution Access, Distribution Delivery, Street Lighting Fixtures, Customer Service, and Measurement.

Q. Once these functional segments are developed, how are they used?

A. These separate functions (or "segments") assist in the development of individual rate schedule components, such as the Service Charge. Once the plant and expenses are functionalized to the proper segment, the allocation process spreads the cost responsibility to the rate classes.

Q. What items are included in each of these segments?

A. The Distribution Access ("Access") segment includes the plant and O&M expenses related to gas services and regulators.

The Distribution Delivery ("Delivery") segment includes all equipment (plant and related O&M) from the city gate interconnections with upstream pipeline suppliers up to the point of connection with gas services, including all metering and regulation stations (the interface with the interstate gas pipelines), gas load dispatching operations, and gas mains. This segment also includes Appliance Services, recovery of regulatory assets, and the plant and non-commodity expenses related to gas production and storage facilities owned by PSE&G. Although these storage and production facilities are included in the Delivery segment, these costs are offset by the customer non-rate-related revenue received directly from the BGSS Supplier for whom these facilities are operated, as stipulated in the Gas Contracts Proceeding in Docket No. GM00080564, and thus do not affect the rates established in this proceeding.[4]

The Street Lighting segment is limited to gas street lighting lamps, posts and services.

The Customer Service segment includes all costs related to billing, inquiry, sales, service and collection activity.

[4] *See In the Matter of the Petition of Public Service Electric and Gas Company's Proposal to Transfer its Rights and Obligations Under its Gas Supply and Capacity Contracts and Operating Agreements to an Unregulated Affiliate and Other Relief*, BPU Docket No. GM00080564.

The Measurement segment includes the costs for meter reading, customer-related meter plant and meter O&M.

Q. Are all costs included in these five segments?

A. Yes, all costs are included in one or more of these of five functional segments.

Access Segment

Q. Please discuss how the Access segment was allocated among the Company's customers classes.

A. The Access segment is the initial link between the shared or common distribution system and the customer's own gas facilities and is comprised of the gas service line from the main in the street to the meter and regulator at the customer's building. The embedded costs for this segment were allocated across the rate classes based on a study of actual installations of gas services.

Delivery Segment

Q. Please discuss how the Delivery segment was allocated among the Company's customer classes.

A. The Delivery segment consists of the portions of the distribution system that are used to serve multiple customers and are physically connected with individual customers' service lines. Basically, this segment includes all of the gas mains in the distribution system. The embedded costs of this segment were allocated across the rate classes through a variety of direct and indirect allocators which are discussed in greater detail in Appendix G-1.

Street Lighting Fixtures Segment

Q. Please discuss how the costs were allocated to the Street Lighting segment.

A. This segment is comprised of the investment for gas street lighting lamps and poles and all associated O&M expenses for this equipment. The gas service dedicated to supplying a gas

streetlight is also segmented to this function. The costs of this segment are allocated solely to the Gas Streetlighting rate class.

Customer Service Segment

Q. Please discuss how the Customer Service costs were allocated to the Company's customer classes.

A. This segment encompasses all costs related to Customer Service type functions, such as costs related to billing, payment receipt and processing, collection activity, and other account maintenance type costs, with the exception of meter reading costs, which are included in the Measurement segment. These costs are allocated to the rate classes based upon a separate cost study of Customer Service functions.

Measurement Segment

Q. Please describe how the Measurement segment costs were allocated to the Company's customer classes.

A. This segment includes costs for meter reading and the investment and O&M expenses related to meters. Meter reading costs are allocated to the rate classes based upon a separate cost study of Customer Service functions, while the meter investment is allocated across the rate classes based upon the relative installed cost of new meters.

Modeling Procedure

Q. Please describe the Company COSS modeling procedure.

A. The Company COSS was developed based upon the weather normalized billing determinants and costs for each of the rate schedules. The revenues received by each rate class were calculated (or target balanced) such that the resulting rate of return ("ROR") for each rate class equals the Company's proposed overall ROR. Schedule SS-G4 contains the complete details

of these final COSS results. Schedule SS-G5 presents a summary report of the revenue requirements by functional segment, while Schedule SS-G6 shows the revenue requirements by function (or segment) for each rate class.

Although Rate Schedule TSG-F and its associated costs are modeled in the COSS, all distribution revenue from Rate Schedule TSG-F flows to the BGSS provider as an offset to the "Non-Gulf Coast Cost of Gas." The revenue requirements associated with Rate Schedule TSG-F must therefore be recovered from the remaining firm customers. The allocation of these revenue requirements will be discussed in detail later in the section titled "Synchronizing the Cost of Service Study to the Rate Design".

After expenses or plant investment-related costs have been entered to the model, usually by FERC account or groups of accounts, a modeling allocator is also entered which performs two functions. The allocator shows:

1. Which of the five segments, or functions, the particular plant or expense item has been attributed to, and
2. The basis on which the particular plant or expense item has been allocated across the rate classes.

The Cost of Service model starts the calculation procedure by allocating the respective plant and expense items to rate classes using an allocator that reflects the reason the cost was incurred. Rate revenues received by each rate class are then target balanced such that the resulting ROR for each rate class equals the Company's proposed overall ROR. The model continues by separating all plant and expense items into appropriate functional segments by rate class, according to the modeling allocator assigned to the particular plant or expense item. The revenue requirement

by segment for each rate class is then calculated to maintain, by rate class, the Company's proposed overall ROR used in the initial calculation.

The Direct and Indirect allocators used in the COSS and a detailed review of how all COSS items are segmented and functionalized are discussed in the Appendix G-1 to my testimony. In that Appendix, a description of how each of the major plant categories (gross plant), is segmented or functionalized is provided. The procedures used on Common and General plant, depreciation reserve, adjustments to rate base, operating revenues, O&M expenses for utility plant, administrative and general ("A&G") expenses, depreciation and amortization expenses, *pro forma* expense adjustments, and finally, taxes are also described.

Q. Please describe how the results of the Company COSS are presented in your schedules.

A. Schedule SS-G4 shows the details of how plant and expense items were separated into each of the five segments and allocated to each category of customers represented by the various rate classifications based upon the extent to which those groups of customers caused the costs. Schedule SS-G4 also shows the results of the allocation for each plant and expense item to each rate class. Schedule SS-G5 presents a high-level summary of expenses, plant, and revenue requirements for each of the five functional segments. Schedule SS-G6 is a summary report of the rate related revenue requirement, by functional segment, for each rate class in total.

The revenue requirements presented in the Company COSS do not include the revenue requirements associated with the SBC or other adjustment clauses or the revenue requirements associated with peaking plant and gas storage facilities. The costs related to the Adjustment Clauses will be collected from customers directly through the appropriate charges, and the revenue requirement associated with the peaking plant or gas storage facilities will be collected directly from the BGSS supplier.

Synchronizing the COSS to the Rate Design

Q. Please explain how the results of the Company COSS were synchronized with the proposed rate design.

A. Two adjustments are made to synchronize the results of the Company COSS to the proposed rate design. The first is an adjustment for the recovery of Rate Schedule TSG-F revenue requirements. The second is to synchronize costs because the COSS test period is different from the period used for the calculation of revenue requirements and rate design. With respect to the recovery of TSG-F revenue requirements, the Stipulation in the Gas Contracts Order, requires that all distribution revenues from Rate TSG-F must flow to the BGSS provider as an offset to BGSS gas costs, not to PSE&G. Thus, although the COSS can be used to determine the revenue requirements associated with Rate Schedule TSG-F, none of the revenue from these customers will flow to PSE&G. Instead, all distribution revenue requirements related to Rate Schedule TSG-F must be recovered from all other firm customers. The calculations to effectuate this requirement are set forth on Page 1 of Schedule SS-G7 (Cost of Service and Rate Design Sync). As indicated, the TSG-F revenue requirement is re-distributed to Rate Schedules RSG, GSG, LVG and SLG on an equal per therm of BGSS-supplied gas basis. The results of this re-distribution by functional segment are set forth on lines 15 to 20 of Page 1 of Schedule SS-G7.

In addition, as previously noted, the Company COSS is based on the period of January to December of 2022 while the Rate Design is based on the test year of June 2023 to May 2024. Thus, it is not possible to use the COSS results directly in the rate design process because the number of customers, therms transported, as well as plant and expenses are slightly different between the two time periods. To properly design rates, the COSS results must be adjusted slightly to correspond to the rate design test year period. The methodology used to synchronize the Cost of Service results is set forth on Page 2 of Schedule SS-G7. Because the primary difference is in

the number of customers and amount of gas delivered, each functional segment's revenue requirement from Schedule SS-G6 was multiplied by the ratio of either the number of customers or gas delivered for the rate design test year to the same value during the COSS test year. The revenue requirements associated with the Distribution Delivery Segment (Row 2) were adjusted by the ratio of the gas delivered in these two periods. The revenue requirements associated with the Access Segment (Row 1), Customer Service Segment (Row 4) and Measurement Segment (Row 5) were adjusted by the ratio of the number of customers in these two periods. The revenue requirements associated with the Street Lighting Segment (Row 3) were adjusted by the ratio of the number of gas streetlights between these two periods. These steps are shown on lines 1 to 15 of page 2 of Schedule SS-G7. The resulting adjusted Company COSS functionalized revenue requirements are each then adjusted on an equal percentage basis so that the total equals the proposed rate related revenue requirements as set forth on lines 16 to 25 of Page 2 of Schedule SS-G7. The final adjusted functionalized revenue requirements are used in the rate design process.

RATE DESIGN

Introduction

Q. What are your objectives for developing the proposed gas rates?

A. The proposed gas rates have been developed to meet several objectives. The primary purpose is to recover revenues equal to the revenue requirement from customers. Additionally, this recovery should be effectuated on an equitable basis that provides the correct price signals to individual customers based on the cost to serve those customers. The final objective is that rates should be simple and understandable for the customer.

Q. Are the proposed rates based solely on the results of the Company COSS?

A. No. The COSS is a guide to appropriate ratemaking; its results are not applied in strict mathematical manner to design the proposed rates. While our goal is to move rates toward a full cost basis, that goal must be balanced against the need to achieve reasonable results.

Q. Do the rates included in your testimony include or exclude New Jersey Sales and Use Tax ("SUT")?

A. The proposed rates described in the next sections of my testimony and associated Schedules exclude SUT unless specifically indicated. However, the appropriate prices both without and with SUT are, included in the Proof of Revenue by Rate Schedule in Schedule SS-G11 as well as the proposed Tariff Sheets set forth in Schedule 3 of Exhibit P-1, and all other schedules that reference rates charged to customers.

Limitations on Rate Changes

Q. Did you develop and apply limits in designing proposed rates in this proceeding?

A. Yes. In order to achieve an overall goal of designing just and reasonable rates, I apply the principle of "gradualism" to temper the rate increases indicated by the Company COSS. To apply the principle of gradualism, I developed and employed a number of limits on the size of the rate increases that are proposed.

Q. Please describe the rate increase limits used in developing the proposed gas rates.

A. The first limit is that the proposed overall percentage revenue increase will be shared, within limits, among all customer classes. Although a primary goal is to move the delivery rates for each rate class toward the cost to serve as indicated by the Company COSS, no class will receive less than 50%, nor more than 150% of the overall average percentage Distribution increase. In addition, no class will receive more than 200% of the overall average percentage bill increase.

These rate increases limits were selected to provide a reasonable balance between the goal of moving towards the cost to serve, and the need to achieve equity among customer classes. The calculation and percentage values of these limits are shown on page 1 of Schedule SS-G8 (Inter Class Revenue Allocations). For Rates RSG, GSG and LVG, any shortfall in the revenue increase (or decrease) from these limitations was transferred to these other rates based upon the magnitude of the revenue increase (or decrease) received by those rates.

Q. Are there any exceptions to the proposed limits?

A. Yes. Because the prices charged for Rate Schedules TSG-NF and CIG are not cost-based but are based upon other considerations such as value of service, the distribution component for these rates was increased by the overall distribution percentage increase to maintain the current relationship in the level of distribution charges to the level of overall Company gas distribution revenue requirements, with the exception of Rate Schedule CSG. These customers have contracted distribution charges, so only the service charges were increased.

Inter Class Revenue Increase Allocations

Q. Please describe the process for allocating the proposed distribution increase to each rate class.

A. Page 1 of Schedule SS-G8 shows the calculation of the overall average percentage increase for Distribution and total bills, as well as the calculation of the upper and lower limits to be used in the inter class revenue increase allocation on Schedule SS-G8, page 2.

Page 2 of Schedule SS-G8 shows the development of the proposed inter-class allocation of the revenue increase. The Rate Schedules are indicated in Column 1, while Column 2 is the Proposed Distribution Revenue Requirement based upon the Company COSS results that were synchronized to the rate design test year. Column 3 is the Present Distribution Revenue, while

Column 4 shows the increase that would occur if the synchronized Company COSS results were used directly, hence the use of the word "Unlimited" in the column heading. Column 5 is the present total bill revenue calculated as if all customers were supplied at BGSS rates. Column 6 is the percentage increase in distribution if the unlimited increase in dollars (from Column 4) were applied to the rates; that is, the percentage increase to each rate schedule if the COSS based increases were applied without constraints. Column 7 is the cost offsets from changes in the Margin Adjustment Clause and the BGSS charges resulting from distribution increases to Rate Schedules TSG-F, TSG-NF, CIG and CSG. The result of the proposed allocation of the Company's revenue requirement increase to the rate classes, consistent with the principles outlined in the previous section, Limitations on Rate Changes, is presented in Column 8 and Column 10. Specifically, Column 8 shows the percentage increase and Column 10 shows the proposed Distribution revenue increase by rate class. Column 9 shows the proposed total bill percentage increase if all customers were supplied at BGSS rates.

Application of these limits is somewhat complex due to the re-distribution of revenue from three sources. Rate Schedule TSG-NF distribution increases are flowed back to customers via the Margin Adjustment Charge (MAC), distribution increases applied to Rate Schedules TSG-F, CIG and CSG flow back to customers as a reduction in their BGSS rates and increases in the rates for gas supplied for pilot use for Rate Schedules TSG-NF and CIG also flow back to firm customers as a reduction in their BGSS rates. All of these credits are as shown in Column 7 of page 2 of Schedule SS-G8. In order to capture these revenue re-distributions correctly, a strict order of which calculations of the inter-class revenue increase allocations was followed.

The first step was the determination of the cost based charges for Rate Schedule TSG-F (as indicated on line 1 of page 2 of Schedule SS-G8). Because the value in Column 7 for Rate

Schedule TSG-F, the "Change in MAC and BGSS Credits" is based upon both the final outcome of the Rate Schedule TSG-F increase, as well as that for Rate Schedules TSG-NF and CIG, a value of zero was first utilized for the calculation. Once the upper and lower percentage distribution increase limits were applied (as shown in Column 8), an initial result for the Proposed Total Bill Increase Percentage (Column 9) and Proposed Distribution Revenue Increase (Column 10) was calculated.

The next step was to determine the increases for Rate Schedules TSG-NF and CIG. The Limited Final Distribution Charge Increase Percentage for Rate Schedule TSG-NF (Line 2, Column 8) was set equal to the overall average distribution charge percentage increase (Page 1, Line 8). For Rate Schedule CIG, the overall average distribution charge percentage increase was used as the Limited Final Distribution Charge Increase Percentage for Rate Schedule CIG (Line 3, Column 8).

Once the initial values for the increase to Rate Schedules TSG-NF, TSG-F and CIG were determined, the change in the MAC charge and BGSS credits could be calculated, and then applied to each of the rate schedules affected as indicated in Column 7. The change in the MAC charge used in this schedule relates only to the change in Rate Schedule TSG-NF margins, and does not include a change in the MAC charge due to current over/under recoveries.

The final step was to calculate the proposed distribution revenue increases for Rate Schedules RSG, GSG and LVG. These calculations were done in the same manner as performed for Rate Schedule TSG-F discussed above, although at this stage, the MAC and BGSS credits (in Column 7) had been calculated. These calculations and the application of the limits were performed in an Excel spreadsheet utilizing the "Goal Seek" function in order to meet all of the

requirements of the limits and to properly allocate any revenue shortfall between these four rates, while recovering the full requested increase in distribution revenue.

Q. How should the rate design be affected if the Board approves an amount other than the Company's overall revenue increase request?

A. If the Board approves an amount other than the Company's overall revenue increase request, the increase to each of the classes should be allocated in proportion to the proposed revenue increase shown in Column 10, Page 2 of Schedule SS-G8.

General Rate Design Principles and Methodology

Q. Please describe the general rate design principles and methodology used in developing the proposed gas rates.

A. The rate design methodology presented in this testimony follows the philosophy of the cost allocation methodology used in the Company COSS. The rate design aligns, as close as practical, the rates (prices charged to customers) with the customers' underlying costs.

Changes in the distribution rates for Rate Schedules TSG-F, CIG, CSG and changes in the charges for pilot use for Rate Schedules TSG-NF, and CIG and CSG are cost offsets to the BGSS rates, and the resulting proposed BGSS tariff sheets have been modified appropriately (as indicated in Schedule 5 of the transmittal letter and in Schedule SS-G12).

The Service Charges for Rate Schedules RSG, GSG, LVG and TSG-F were set to move towards the revenue requirements indicated in the Company COSS for the sum of the Access, Customer Service, and Measurement segments. Except for the Residential Service Gas (RSG) Rate Class, which is discussed in the rate class specific changes portion of my testimony, the change in the Service Charges was limited to the same general inter rate class limits of no more than 150% of the overall average Distribution percentage increase. The proposed Service Charges on Rate Schedules TSG-NF and CSG were set equal to the Service Charge on Rate Schedule TSG-

F and the Service Charge for Rate Schedule CIG was increased in an amount equal to the overall average distribution percentage increase.

These limits were selected to provide a reasonable balance between the goal of moving each rate component towards costs, and the goal of achieving reasonable bill impacts. Any shortfall in Service Charge revenue resulting from these limitations was transferred to the remaining Distribution Charges of each rate schedule. In general, the Distribution Charges for each Rate Schedule were set to recover all the revenue requirements of the Distribution Delivery segment, plus any shortfall created from limitations in the proposed Service Charges. The calculations of the proposed Service Charges are found on Schedule SS-G10.

RATE SCHEDULE SPECIFIC CHANGES

Rate Schedule Residential Service Gas ("RSG")

Q. Please describe the rate design for Rate Schedule RSG.

A. Currently, Rate Schedule RSG is below its cost to serve. In addition, as indicated in Schedule SS-G9 Service Charge Calculations, (line 2), the Company COSS indicates that an increase in the monthly Service Charge is warranted, while the current Distribution Charge per Therm is above cost. Therefore, the Company proposes to increase the service charge corresponding to Service Charge limits discussed earlier. This will ensure that the Service Charge and Distribution Charge per Therm rate, will continue to move closer to the cost to serve.

The Distribution Charge for the Special Provision for Off-Peak use has been set at one-half the normal Distribution Charge. This is a continuation of the practice to provide a reasonable balance between providing the correct price signals to customers with gas air conditioning, while providing some contribution to offset winter peak period costs (and thus rates). No changes are proposed for qualification for this Off-Peak provision.

The results of the Rate Schedule RSG rate design appear on page 5 of the Proof of Revenue in Schedule SS-G11. The general format of the calculations is described on the first page of that Schedule. The calculation of the annual gas commodity cost utilized in the Proof of Revenues for this and all other rate schedules is based upon all customers purchasing gas on the appropriate BGSS service as presented in Schedule SS-G10. The magnitude of the BGSS values remain constant in both sides in the Proof of Revenue (Schedule SS-G11) and their inclusion allows the proposed rate changes to be viewed in the context of a customer's overall bill.

The calculation for the changes in the MAC clause resulting from the change in flow back from the TSG-NF rates is included in Schedule SS-G8. Typical residential customer bill impacts as a result of these changes are shown on page 1 and 2 of Schedule SS-G12.

Rate Schedule General Service Gas ("GSG")

Q. Please describe the rate design for Rate Schedule GSG.

A. The Service Charge was set to move towards the Company COSS results to recover the revenue requirements for the Access, Customer Service and Measurement segments utilizing the previously discussed limits as shown in Schedule SS-G9.

The Distribution Charge was set utilizing the balance of the Proposed GSG Distribution Revenue Increase from Schedule SS-G8.

As with Rate Schedule RSG, the Distribution Charge for the Special Provision for Off-Peak use has continued to be set at one-half of the normal Distribution Charge. This continues the practice of providing a reasonable balance between providing the correct price signals to customers with gas air conditioning, while providing some contribution to offset winter peak period costs (and thus rates). No changes are proposed for qualification for this Off-Peak provision.

The results of the Rate Schedule GSG rate design are shown on page 7 of Schedule SS-G11. The general format of the calculations is described on the first page of that Schedule. The typical customer bill impacts as a result of these changes are shown on page 3 and 4 of Schedule SS-G12.

Rate Schedule Large Volume Gas ("LVG")

Q. Please describe the rate design for Rate Schedule LVG.

A. Similar to what was done for Rate Schedule GSG, the LVG Service Charge was set to move towards the Company COSS results to recover the revenue requirements for the Access, Customer Service and Measurement segments utilizing the previously discussed limits as shown in Schedule SS-G9.

The Distribution Charges and Demand Charge were set to recover the balance of the revenue requirements. As I have previously discussed, the majority of gas distribution related costs are relatively fixed, and do not vary with the monthly volumes of gas transported.

In order to meet the rate design goals outlined at the start of this Section of my testimony, and to prevent unintended customer migration between Rate Schedules GSG and LVG, the Rate Schedule LVG rate maintains the existing rate design principle that a bill for a 12,000 therm per year customer be approximately the same for Rate Schedules GSG and LVG. With this in mind, the demand charge was set to recover the same percentage of the distribution revenue as currently. The block one and block two charges were then calculated to uniquely recover the balance of the Rate Schedule LVG revenue requirements and maintain LVG/GSG bill neutrality at 12,000 therms per year, distributed on the monthly usage pattern of the average GSG customer.

The results of the Rate Schedule LVG rate design are shown on page 9 of Schedule SS-G11. The general format of the calculations is described on the first page of that Schedule.

Information on the typical customer bill impacts as a result of these changes is indicated on page 5 and 6 of Schedule SS-G12.

Rate Schedule Street Lighting Gas ("SLG")

Q. Please describe the rate design for Rate Schedule SLG.

A. The Company proposes to increase the Distribution Charge per Therm to its cost to serve as determined by the COSS.

The balance of the revenue requirements will be recovered from the luminaire charge, and the prices for individual gas streetlights will be updated but limited by the overall rate impact limitations I have previously discussed.

The results of the Rate Schedule SLG rate design are shown on page 13 of Schedule SS-G11. The general format of the calculations is described on the first page of that Schedule.

Rate Schedule Transportation Service Gas – Firm ("TSG-F")

Q. Please describe the rate design for Rate Schedule TSG-F.

A. This rate remains closed except to existing customers. The Service Charge was set to move towards the Company COSS results to recover the revenue requirements for the Access, Customer Service and Measurement segments while applying the previously discussed limits as shown in Schedule SS-G9. The balance of the revenue increase is proposed to be recovered proportionally from the volumetric Distribution Charge and the Demand Charge. The results of the Rate Schedule TSG-F rate design are shown on page 15 of Schedule SS-G11. The general format of the calculations is described on the first page of that Schedule.

Rate Schedule Transportation Service Gas – Non Firm ("TSG-NF")

Q. Please describe the rate design for Rate Schedule TSG-NF.

A. The Service Charge for TSG-NF has been set equal to the new Service Charge proposed for Rate TSG-F, the calculation of which is shown on Schedule SS-G9. The charge for gas used for pilots during an interruption is proposed to be increased, based on the highest monthly price for gas service on Rate Schedule GSG, including balancing charges and gas supply service on BGSS-F, that occurred in the prior 36 month period.

Special Provision (a) has been modified to add penalty language if a customer does not provide an alternative fuel capability affidavit by November 1st.

The results of the Rate Schedule TSG-NF rate design are shown on page 17 of Schedule SS-G11. The general format of the calculations is described on the first page of that Schedule.

Rate Schedule Co-Generation Industrial Gas ("CIG")

Q. Please describe the rate design for Rate Schedule CIG.

A. This rate remains closed except to existing customers. Because the Service Charge was never based on cost, it was increased by the overall average Distribution percentage increase.

The Company proposes to modify the margin component of the rate so that the net of all of the adjustments to the Estimated Average Commodity Cost per therm that are used to determine the price paid by customers is increased by the overall average Distribution percentage increase. The differential charge for the two usage blocks of Rate Schedule CIG, usage less than 600,000 therms per month and usage in excess of this amount, has been kept at the same one cent per therm differential that currently exists.

The results of the rate design are shown on page 11 of Schedule SS-G11. The general format of the calculations is described on the first page of that Schedule.

Rate Schedule Contract Service Gas ("CSG")

Q. Please describe the rate design for Rate Schedule CSG.

A. The Service Charge for CSG has been set equal to the new Service Charge proposed for Rate TSG-F, the calculation of which is shown on Schedule SS-G9. Because the distribution charge for CSG customers is not based on cost the majority of customers on this rate class will receive no change in their per therm distribution rate with the exception of those that are contracted to have their charges adjusted during base rate proceedings.

TARIFF CHANGES

Q. Are you proposing any further changes to the proposed tariff?

A. Yes. Please refer to the Guide to Gas Tariff Changes, Exhibit P-1 Schedule 4.

TAX ADJUSTMENT CREDIT ("TAC")

Q. Please briefly describe the TAC Mechanism.

A. The TAC mechanism was established in the 2018 Rate Case Order, to flow back certain tax benefits to customers.

Q. Please briefly describe PSE&G's proposed TAC adjustments.

A. As described in more detail in the testimony of Mr. Pardo, the Company is proposing the following adjustments to the TAC:

1) In addition to continuing to flow back the benefit of the historic Safe Harbor Adjusted Repair Expense ("SHARE") deduction, the Company proposes to flow back to customers the net federal tax benefit associated with the historical Mixed Service accumulated deferred income taxes ("ADIT") balance over approximately five years.
2) The Company proposes to add the current Mixed Service deduction net benefit to the current SHARE deduction net benefit already included in the TAC, but both at a pre-

determined, fixed annual amount, with any excess to be flowed back to customers in a subsequent rate case; and

3) To better match the seasonal flow of Company pre-tax income, the Company began to amortize the monthly flow back of excess deferred income taxes ("EDIT") and SHARE on a seasonal basis in the 2023 TAC filing to match pre-tax income as described in the 2023 TAC cost recovery proceeding. In this proceeding, the Company is aligning the return calculation with the seasonal amortization methodology.

Q. Does the Company have an amortization schedule for the proposed amortizations?

A. Yes, the proposed amortizations are included in summary format in rows 167-170 in worksheet 'RevReq-G' of WP-SS-TAC-1.xlsx for 2025 through 2028.

Q. How does the Company propose to modify the TAC revenue requirement formula based upon the changes discussed previously?

A. The TAC revenue requirement formula is calculated monthly and will be modified with the ***bolded items*** below:

TAC Revenue Requirement = (Amortization of Protected ADIT Balance +(Amortization of Historic SHARE ADIT) Balance + ***(Amortization of Historic MSC Deduction ADIT Balance*** *+ After-tax Return on Cumulative Historic SHARE Deduction ADIT Change +* ***After-tax Return on Cumulative Historic MSC Deduction ADIT Change*** *+* ***Pre-set*** *SHARE Deduction Flow-Through +* ***Pre-Set MSC Deduction Flow-Through*** *+ IRS Audit Electric Adjustments + Other Major Gas Tax Adjustments) * Gas Revenue Factor*

See Schedule SS-TAC-2G for the monthly net revenue requirement calculations.

Q. What is the TAC amount for the initial period after base rates are projected to take effect in this proceeding?

A. The gas net revenue requirement for the initial 16-month period of September 1, 2024 through December 31, 2025 is a credit to gas customers of $252.6 million or $197.8 million on an annualized basis. See Schedule SS-TAC-1.

DISTRIBUTION ADJUSTMENT CHARGE AND STORM RECOVERY CHARGE ("SRC")

SRC Mechanism

Q. Please briefly describe the Company's proposed SRC.

A. As described in the testimony of Mr. McFadden, the Company is proposing a SRC to:

1. Recover the deferred major storm costs that have been incurred since 2018 with interest.
2. Defer and then recover future major storm costs, including interest, through subsequent true-up filings.

Q. Please describe the methodology used to calculate the SRC recovery.

A. The Company is proposing a new Distribution Adjustment Charge ("DAC") clause in its gas tariff with the SRC as a new component of the DAC. The DAC was proposed by the Company in its COVID-19 cost recovery filing where COVID-19 Recovery Charge would also be a component of the DAC. The details of the SRC and the recovery mechanism are described below. The following formula describes the SRC mechanism:

SRC Balance = Prior Month SRC Balance – SRC Revenue + Incremental Deferred Major Storm Costs + Interest Expense

Q. How will the SRC be charged or refunded to customers?

A. The Company proposes to charge or refund the SRC through a new component of the Company's proposed DAC in the Company's gas tariff. The charges will be applied to each therm of a customer's usage and will apply to all gas customers.

SRC Components

Q. What is the Initial SRC Balance?

A. The Initial SRC Balance is the total incremental deferred major storm costs associated with major storms since the Company's last Base Rate Case in 2018 prior to the implementation of the SRC rate.

Q. What are the "Incremental Deferred Major Storm Expenses?"

A. The Incremental Deferred Major Storm Costs are those monthly costs that occur after the implementation of the SRC rate.

Q. What is the "Interest Expense?"

A. The Interest Expense is the monthly carrying costs related to the SRC Balance. It is calculated as following ((Prior Month SRC Balance + (– SRC Revenue + Monthly Activity + Prior Month SRC Balance)) / 2) x (Annual Interest Rate / 12). In calculating the Interest Expense, the annual interest rate is based upon the Company's interest rate obtained on its commercial paper and/or bank credit lines utilized in the preceding month. If both commercial paper and bank credit lines have been utilized, the weighted average of both sources of capital shall be used. In the event that neither commercial paper nor bank credit lines were utilized in the preceding month, the last calculated rate will be used. The interest rate shall not exceed PSE&G's overall rate of return as authorized by the Board as utilized in calculating revenue requirements for the corresponding period. The calculation of the monthly interest can be found in Schedule SS-SRC-1G, Page 1.

Q. How does the Company propose to calculate the initial SRC Rate?

A. The Company proposes to set the initial SRC Rate to recover these costs over a three- year period including interest. The rate will be a rate applied to all gas customers where applicable. See Schedule SS-SRC-1G, Page 2 for the calculation.

Q. When does the Company propose to submit subsequent SRC filings to change the SRC?

A. The Company plans to submit a periodic SRC filing to change the SRC rate if warranted based upon the projected SRC over/under balance.

Q. When will storm costs be reviewed for prudency?

A. The Company proposes that all storm costs will be reviewed as part of subsequent SRC filings.

Q. When is the initial implementation of the SRC anticipated to occur?

A. The SRC is proposed to be effective September 1, 2024 corresponding to the change in base rates as a result of this proceeding. If the Board approves new base rates earlier or later than September 1, 2024, the initial rate period and corresponding rate will be adjusted accordingly from the effective date of the Board Order.

Q. What is the SRC amount for the initial period after base rates are projected to take effect in this proceeding?

A. The gas net revenue requirement for the initial annual period of September 1, 2024 through August 31, 2025 is a charge to gas customers of $1.3 million. See Schedule SS-SRC-1G.

GAS BAD DEBT RECOVERED VIA THE SBC

Q. Is the Company proposing to change the recovery method of gas bad debt expenses currently recovered from customers?

A. Yes. As described in the testimony of Mr. McFadden, the Company is proposing to change the recovery method of its gas bad debt expenses.

Q. What is PSE&G's proposal in this proceeding?

A. Consistent with my testimony in the COVID-19 proceeding, the Company proposes that gas bad debt expenses be recovered through a new Social Programs component of the Gas SBC,

consistent with the recovery of electric bad debt expense via the Social Programs component of the Electric SBC.

Q. Please describe the calculation method of Social Programs component of the Gas SBC and how it will be collected from customers?

A. The proposed Social Programs component of the Gas SBC will be calculated in a manner almost identical to the Social Programs component of the Company's Electric SBC. Schedule SS-SBC-1 contains the proposed rate calculation that will be effective concurrent with the effective date of the proposed base rates. This rate will be applicable to gas customers who currently pay the Gas SBC. Schedule SS-SBC-2 calculates the Over / (Under) Balances based upon the monthly revenue collected and gas bad debt expense. Interest calculated on the accumulated balance will be calculated identical to the method used to calculate interest for the Social Programs component of the Electric SBC, calculated monthly and added to the accumulated balance at end of each rate period. The interest rate will used will be the 2-year Treasury Bill rate plus 60 basis points, updated every August 1st each year. Schedule SS-SBC-3 calculates the annual forecasted revenue by rate schedule for the initial period commencing with the implementation of the proposed base rates.

STAFF COSS METHODOLOGY

Q. Please explain why you are submitting the Staff COSS.

A. As part of the 2018 Rate Case Order, the Company agreed to perform a COSS in the manner prescribed by Staff in the Company's next rate case. The Staff COSS and the summary of the resulting functional revenue requirements by rate class has been submitted herein with the Company's current proposed rate case filing.

Specifically, Schedule SS-G13 contains the Details of the complete Staff COSS, Schedule SS-G14 is the Summary Report by Functional Segment based on Staff's Method, and Schedule SS-G15 is the Functional Cost Summary of the COSS results based on Staff's Method.

In the Stipulation that resolved the 2018 Rate Case, the parties made it clear that they were not agreeing that the Staff COSS was appropriate, was consistent with cost causation principles, or would be a useful guide in determining just and reasonable rates. Specifically, the Stipulation stated (at 11-12):

> All parties will be free to submit any number of alternative cost of service methodologies for the Board's consideration in future cases. The Company and any Signatory to this agreement will have the right to file and support any COSS method it considers appropriate.[5]

Q. Does the Company believe that the Staff COSS provides a reasonable foundation for establishing just and reasonable rates in this proceeding?

A. No. The Staff COSS Methodology is not an appropriate methodology to use to establish just and reasonable rates because it does not achieve a result that is tied to cost causation. Instead, the Staff COSS goes to extraordinary and convoluted lengths to allocate and functionalize costs away from residential customers and onto the shoulders of commercial and industrial customers. While it may be reasonable to moderate the level of increase to be borne by residential customers, the vehicle for doing so should not be an COSS that arbitrarily transfers costs to businesses operating in the Company's service territory. The Company has taken reasonable steps to moderate the level of increase in rates for Rate Schedules RSG and GSG customers with its gradualism-based recommendations that limit the amount of increases for those classes.

The "Average and Excess" methodology underlying the Staff COSS has existed for many years. Historically this method was used to allocate costs of electric generation plant and gas production facilities where, arguably, there is an energy investment component beyond that necessary to provide capacity at the time of peak load. However, there is no evidence that costs for Public Service's gas distribution service business are caused for such reasons. It is beyond

[5] 2018 Rate Case Order at Stipulation ¶ 25.

dispute that the Company's existing design criteria is based solely on peak demand. Thus, the Staff COSS has no relationship to actual distribution plant costs or operations. As testified to by Mr. Schmid in this case, the distribution planners and designers plan and install facilities to meet the peak demands of customers – not based on the amount of energy (in therms) they consume.

The fundamental error in the Staff COSS is that there is no relationship at all between the amount of gas a pipe can carry, its diameter, and any split between a demand and energy cost classification. Determining an energy/peak classification based on the physical nature of natural gas and the pipe it flows within is unrelated to determining the cost of providing gas distribution service. Just because equipment such as gas main delivers energy, such as a gas main, it should not be classified as energy-related unless the amount of energy, other than peak energy, had some basis in the design. Gas mains have been, and continue to be, installed to bring gas service to the proximity of each customer's premise and are sized to handle the peak hourly gas flow at design conditions, without regard to the gas flow at any other time of day or season. These are the sole reasons and engineering basis for their design and cost, and as such, the allocation of these costs should properly reflect each rate class's responsibility for the peak gas flow.

Subsequent Base Case Requirements

Q. Do you believe that the Company should be required to complete the Staff COSS in subsequent base rate case filings?

A. No. The Company is requesting that this requirement not be included for the filing of its next base rate case.

Q. Does this conclude your direct testimony?

A. Yes. It does.

APPENDIX G-1 - DETAILED REVIEW OF COST OF SERVICE STUDY

Schedule SS-G4 shows the details of the Cost of Service Study used to develop distribution revenue requirements by rate schedule. This study was used in the development of the proposed rates and the following discussion is limited to this analysis. These results are summarized by revenue requirements for each rate schedule and by segment in Schedule SS-G6.

The study, as previously mentioned, is based on weather normalized costs and billing determinants for the 12 month period ending December 31, 2022, and is limited to the gas delivery business.

ALLOCATOR NAMING CONVENTION

For consistency and simplicity of bookkeeping, a naming convention has been developed for the modeling allocators.

Direct Allocators

All modeling allocators that end in a dash and a number (such as "PEAKHOUR-03") are direct allocators, meaning that:

1. The word portion of the direct allocator denotes the types of external constant or value used to allocate the plant or expense item as indicated by the name of the modeling allocator. For example, the "PEAKHOUR" denotes the Coincident Peak Hour demand of the entire system observed at the City Gate, and
2. The number portion of the direct allocator denotes the segment to which the plant or expense item is functionalized. For example, the "03" in "PEAKHOUR-03" denotes segment number 3. The business segment numbering method used in our analysis is as follows:

Segment #2 - Distribution Access

Segment #3 - Distribution Delivery

Segment #4 – Street Lighting Fixtures

Segment #5 - Customer Service

Segment #6 - Measurement

Note that labels for Segments #1 is not used.

Indirect Allocators

All modeling allocators that do not end in a dash and a number (such as A&GEXP) are indirect allocators, meaning that they will both segment and allocate costs in the same proportion as other individual or group of plant or expense items. The names of these modeling allocators are an indication of the basis upon which this allocation and functionalization process takes place.

ALLOCATION DETAILS

Intangible Plant

Gas intangible plant (Accounts G301 to G303) was not included in the study

Production Plant

All production plant (Accounts G304 to G320 on Schedule SS-G4, page 4, line 26) was determined to be related to wholesale balancing services and thus segmented to the Distribution Delivery segment and allocated on the basis of the total balancing therms for each rate schedule. This allocator (BALANCE-04) is the same allocator used throughout the Cost of Service model for all production plant assets and expenses, as well as the revenue received from the BGSS Supplier for the operation of these facilities.

Storage Plant

Storage plant (Schedule SS-G4, page 4, line 30 to 33) is treated in the same manner as production plant because it relates to balancing services. Therefore, Storage plant is segmented to Distribution Delivery and allocated on the basis of balancing therms.

Transmission Plant

All of transmission plant (Accounts G365 to G369 on Schedule SS-G4, page 4, lines 35 to 40) was determined to be related to the Distribution Delivery segment. A majority of this plant is for large gas pipes (transmission mains), which are classified as transmission mains rather than distribution mains in accordance with federal and state regulations generally due to the high operating pressure and larger size. Since these facilities perform the same type of function as distribution mains, the plant has been treated in an identical manner to that of distribution mains and allocated to the rates based upon each class's share of the amount of gas transported at the system design peak hour.

Distribution Plant

In the regulated gas distribution business determining cost causation for the revenue requirements related to gas mains and to gas services is one of the most important issues because together these facilities comprise the vast majority of rate base and are the basis for much of the operations and maintenance expenses. The majority of Distribution Plant (Accounts G374 to G388 as shown on Schedule SS-G4, page 5, line 46, to page 6, line 119) has been functionalized to four primary segments – Distribution Delivery, Distribution Access, Street Lighting Fixtures and Measurement. The plant related to Land and Structures (Accounts G374 and G375) is related to local Distribution operations field offices, and was functionalized and allocated in the same proportion as

Distribution plant in total. Gas mains have been functionalized to the Distribution Delivery segment, gas services and house regulators to the Distribution Access segment, meters to the Measurement segment, and all gas street lighting related equipment to the Street Lighting Fixtures segment.

After the functionalization was completed, each account was then examined to determine the proper allocation across rate classes. Investment for Gas Services (G380), Gas Meters (G381, G382, G385), and House Regulators (G383, G384) was then allocated to Rate Schedules RSG, GSG and LVG. This was based upon a study of actual customer installations and using the results as the basis for determining the relative investment for all customers. For the reasons that I have previously discussed, the investment for Gas Mains (Account G376) was allocated to all classes on the basis of each class's share of the amount of gas transported at the system design peak hour.

The investment in Compressor Station Equipment (Account G377) is generally determined to be related to the natural gas refueling stations located at several Public Service locations that are utilized to fuel the natural gas cars and trucks used by the Company. Any costs in this account shall be segmented to Distribution Delivery and allocated in the same manner as total Distribution Plant other than meters. All Street Lighting Facilities (G387) including the services, posts, and heads were directly assigned to Rate SLG.

Other Distribution Plant

The plant associated with Asset Retirement Obligations (booked in Account G388) relates almost exclusively to gas mains, and therefore was functionalized and allocated in the same proportion as gas mains.

General, Common and Other Plant

An accounting code, or Business Code, associated with the actual gross plant balances indicating the department to which the plant is assigned was used to segment both the general (Accounts G389 to G399) and common (Accounts C303, and C389 to C399) plant account items (Schedule SS-G4, page 4 for C303 and page 7 for general and common). Each Business Code was then grouped by function to be allocated based on cost causation. For example; a Description for office furniture and equipment was added to the Customer Service segment and allocated in the same proportion as all Customer Service activities. In other cases, where some of the facilities, such as vehicles, etc. used by the Customer Operations Department are shared between groups that are responsible for meter reading and those that provide general customer service (collections, phone inquiry, walk-in payment centers, etc.), these investments were further split in the Cost of Service Study between the Measurement segment and the Customer Service segment based on the proportion of work performed by each group. In general, all general and common investments were allocated to the rate schedules in the same proportion as the overall respective plant accounts for each segment. Items for which no reasonable functionalization could be determined were classified as "unassigned" and allocated in the same proportion as its associated plant account. In other words, unassigned general plant followed general plant and unassigned common plant followed common plant (general plant is shown on Schedule SS-G4, page 7 line 94 to line 102; while common plant is on Schedule SS-G4, page 7 line 105 to line 112).

Depreciation Reserve

The depreciation reserve associated with Accounts G300 to G399 was segmented and allocated in the same proportion as its associated plant account (Schedule SS-G4, page 8, line 1 to page 10, line 114).

Adjustments to Develop Rate Base

Adjustments to net plant used to develop Rate Base consist primarily of working capital and deferred taxes for the distribution utility. The underlying components of working capital were analyzed and segmented according to their individual use. Working capital requirements associated with Material and Supplies were allocated and segmented in proportion to the total plant, other than General and Common. Working capital requirements associated with Cash and Prepayments & Working Funds were allocated and segmented in the same proportion as the total of O&M and capital additions (essentially cash outlays) through the use of the allocator termed "EXPENDITURES". Deferred taxes were segmented and allocated in proportion to the related plant values. These adjustments are indicated in Schedule SS-G4, page 11, lines 1 to 37.

Operating Revenues

The values indicated in Schedule SS-G4, page 2, line 52 entitled "Rate Revenues from Customers" are the portion of the total target balanced revenue requirements that are necessary to be recovered from rate-related revenues (from service charges, distribution charges, minimum charges, etc.) at the proposed overall ROR, plus the increases in non rate-related revenues.

The effects of other non-rate-related revenues are booked to Accounts G487 to G495 and are shown in Schedule SS-G4, page 12, lines 9 to 19. The primary sources of these other revenues, booked in Account G488, are Competitive Services. These services have been segmented to the Distribution Delivery segment and allocated back to the customer rates from which the revenue was received, and Peaking Services (revenue from the BGSS Supplier for the operation of the peaking facilities), which constitutes the majority of the revenue booked in Account G495 and is segmented to Distribution Delivery and allocated based on balancing therms.

Production Expenses

Similar to the production plant items, all production expenses (Accounts G710 to G745 on Schedule SS-G4, page 13, lines 4 to 6) relate to wholesale balancing services and are segmented to Distribution Delivery and allocated on the basis of balancing therms, consistent with the methodology used for Production Plant.

Gas Supply Expenses

Although booked to Other Gas Supply Expenses - Account G813, any costs charged herein, relate to the operation of the Gas Systems Operations Center (GSOC) and thus are related to gas dispatching. Therefore, any costs in this Account shall be segmented to the Delivery segment and allocated on the basis of total therms delivered. This is shown on Schedule SS-G4, page 13, line 18.

Other Storage Expenses

The costs associated with the operation and maintenance of Company owned storage facilities (Account G840-G843 on Schedule SS-G4, page 13, lines 22 to 25) are treated in the same manner as production plant and segmented to Distribution Delivery and allocated on the basis of balancing therms.

Transmission and Distribution O&M Expenses

O&M expenses for transmission and distribution (Accounts G850 to G894 on Schedule SS-G4, page 13, line 28 to page 14, line 68) were generally segmented and allocated in the same proportion as their associated plant account(s) with the exception of Customer Installations expense (Account G879) which was allocated to the rates based upon an analysis of the customers for which that work was performed.

Customer Accounts, Service and Sales Expense

Expenses from a wide range of customer contact activities are booked to Accounts G901 to G916. A separate analysis was performed on the costs charged to each of these accounts to determine the best functionalization fit. The details of this account-by-account functionalization can be found on Schedule SS-G4, page 14, line 73 to page 15, line 108. The costs in each of these accounts related to meter reading were segmented to the Measurement segment and allocated on the basis of the costs to read meters for each rate class; the portion related to billing was segmented to the Customer Service segment and allocated on the relative costs of billing by rate class; the portion related to account maintenance activities (including answering general questions, setting up new accounts, remittance processing, and collection activities) was segmented to the Customer Service segment and allocated on the relative costs of performing these activities by rate class; and the portion of these expenses related to general regulated utility responsibilities was segmented to the Distribution Delivery segment and allocated on the relative costs of performing these activities by rate class. The portion of Customer Records and Collection costs (Account G903 and G905) associated with costs to disconnect customers for non-payment of bills (and their eventual reconnection) were segmented to the Customer Service segment and allocated based upon the number of customers.

Energy Efficiency and Renewable Energy expenses, a component of the SBC, normally recorded in Account G908 were not included in this analysis as discussed earlier in this testimony and as indicated on page 1 of Schedule SS-G3.

Administrative and General (A&G) Expenses

Administrative and General Expenses (Accounts G920-935) include a mix of expenditures, which were analyzed separately to determine the best functionalization fit. The details of this item-by-item functionalization can be found on Schedule SS-G4, page 15, lines 115 to 132.

An adjustment was made to the A&G expenses for G923 and G926 to separate those costs associated with the Gas Peaking Plants and to segment them to the Distribution Delivery segment. These costs were then allocated on the basis of balancing therms, similar to the method applied to other gas production related investment and expenses.

Depreciation and Amortization Expenses

All depreciation and amortization expenses were segmented and allocated in the same proportion as their associated plant accounts (Schedule SS-G4, page 17, lines 1 to 27).

Taxes Other Than Income Taxes

Other non-income type taxes were allocated based on their relationship to other plant and expenses, as indicated on Schedule SS-G4, page 18, lines 4 to 12.

Pro Forma Expense Adjustments

The pro forma adjustments the Company is proposing are summarized in Schedule MPM-29 and detailed as Adjustments #1 to #24 in Schedules MPM-30 through MPM-53 of Mr. McFaddens' direct testimony in this proceeding. Those adjustments are included in this section of the Cost of Service Study on Schedule SS-G4, page 18, lines 16 to page 19 lines 57, with the exception of the pro forma adjustments discussed below.

One specific adjustment, Pro Forma Adjustment #11 Schedule MPM-29 adjusts revenue related to the switching between Rate Schedules TSG-NF and LVG. The Company currently

retains a portion of the margins from gas service to new TSG-NF customers that commenced after the Company's base rate cases in 2001 and 2005, in accordance with the Settlements and Board Orders in Docket Nos. GR01050297 and GR05100845. Also, the Company retains the margins (total revenue less commodity revenue, SUT, SBC, and GPRC) from customers who switch from Rate Schedule LVG to TSG-NF. Conversely, the margins from customers who switch from TSG-NF to LVG are credited to the Margin Adjustment Charge (MAC) in lieu of being retained by the Company. The balance of the margin is credited to the MAC. These retained amounts are reset to zero in each succeeding base rate case. Therefore, this adjustment decreased operating income in the amount of $748,205.

Each pro forma adjustment included in the Cost of Service Study was segmented and allocated in the same proportion as the associated plant or O&M account(s). The Cost of Service modeling of Pro Forma #3 associated with Interest Synchronization, Pro Forma #5 associated with Gas COLI Interest Expense, and Pro Forma #7 associated with Gains and Losses on Sales of Property all include the added tax effects on revenue requirements as an additional expense. Those pro forma adjustments excluded from the Cost of Service Study are as follows:

- Adjustment #6- Weather Normalization Adjustment (Schedule MPM-29) is a weather normalization of operating revenues. The Cost of Service Study is already based on weather normalized costs and usage, and no further adjustment is required.
- Adjustment #11 – TSG-NF Margin Sharing (Schedule MPM-29) is related to the elimination of margin sharing revenue associated with capital investment made for TSG-NF customers since the last base case. Because these investments are already included in the proposed Rate Base, the revenue requirements related to these investments are already included in the Cost of Service Study.

Taxes

All Taxes and Tax Deductions were segmented and allocated in the same proportion as their associated plant or O&M account(s). Details of these allocations are indicated from pages 20-25 of Schedule SS-G4.

CREDENTIALS
OF
STEPHEN SWETZ
SR. DIRECTOR-CORPORATE RATES AND REVENUE REQUIREMENTS

My name is Stephen Swetz and I am employed by PSEG Services Corporation. I am the Sr. Director - Corporate Rates and Revenue Requirements where my main responsibility is to contribute to the development and implementation of electric and gas rates for Public Service Electric and Gas Company (PSE&G, the Company).

WORK EXPERIENCE

I have over 30 years of experience in Rates, Financial Analysis and Operations for three Fortune 500 companies. Since 1991, I have worked in various positions within PSEG. I have spent most of my career contributing to the development and implementation of PSE&G electric and gas rates, revenue requirements, pricing and corporate planning with over 20 years of direct experience in Northeastern retail and wholesale electric and gas markets.

As Sr. Director of the Corporate Rates and Revenue Requirements department, I have submitted pre-filed direct cost recovery testimony as well as oral testimony to the New Jersey Board of Public Utilities and the New Jersey Office of Administrative Law for base rate cases, as well as a number of clauses including infrastructure investments, renewable energy, and energy efficiency programs. A list of my prior testimonies can be found on pages 3 and 4 of this document. I have also

contributed to other filings including unbundling electric rates and Off-Tariff Rate Agreements. I have had a leadership role in various economic analyses, asset valuations, rate design, pricing efforts and cost of service studies.

I am an active member of the American Gas Association's Rate and Strategic Issues Committee, the Edison Electric Institute's Rates and Regulatory Affairs Committee and the New Jersey Utility Association (NJUA) Finance and Regulatory Committee.

EDUCATIONAL BACKGROUND

I hold a B.S. in Mechanical Engineering from Worcester Polytechnic Institute and an MBA from Fairleigh Dickinson University.

53 BGSS-RSG "Weather Normalized All" - used tariff rates with out SUT (effective 6/1/2023 the rate was $0.442408; and effective as of 10/1/2023 the rate is $0.372799).
54 BGSS-RSG excludes Off-Peak volume because it has its own specific BGSS-RSGOP rate (effective as of 5/1/2023 the rate is $0.279082). Applicable May - October only.
55 BGSS-RSG does not include any BGSS-RSG Bill Credits.
56 GSG includes Off-Peak usage.
57 All BGSS rates (BGSS-Firm, BGSS-Interruptible, BGSS-CIG) are monthly changing rates and are based on the most current Tariff rates applicable for that month.
58 All BGSS rates exclude SUT.

Gas Proof of Revenue by Rate Schedule

Narrative for Rate Schedule Design

The summary and each rate schedule provide the details of 1) a) Actual and b) Weather Normalized and also 2) a) Annualized Weather Normalized (all customers assumed to be on BGSS and revenue based on current tariff rates), b) the Proposed rate design.

1) Actual and Weather Normalized

All the components are separated into Delivery and Supply. In addition to the Distribution components of Delivery, also included in the schedule are lines for Balancing Charge, Societal Benefits Charge, Margin Adjustment Charge, Gas Conservation Incentive Program, Green Programs Recovery Charge, Tax Adjustment Credit, Facilities Charge, Minimum Charge, Miscellaneous items, and Unbilled Revenue. The first column shows the actual billing units for the test year from Schedule SS-G2. The second column shows annual average rates (without Sales and Use Tax, SUT) occurring during the test period. The commodity rates in the second column reflect class-weighted averages for the test year from SS-G11. The third column presents annualized revenue for the test period. The fourth column shows the weather normalized billing units for the test year from SS-G2. The fifth column shows the applicable rates. Column six (6) presents weather normalized revenue. Columns seven (7) and eight (8) show the differential revenue, in thousands of dollars and percent increase, respectively, for each of the billing unit blocks.

2) Annualized Weather Normalized (all customers assumed to be on BGSS) and the Proposed rate design.

All the components are separated into Delivery and Supply. In addition to the Distribution components of Delivery, also included in the Schedule are lines for Balancing Charge, Societal Benefits Charge, Margin Adjustment Charge, Gas Conservation Incentive Program, Green Programs Recovery Charge, Tax Adjustment Credit, Facilities Charge, Minimum Charge, Miscellaneous items, and Unbilled Revenue. The first column shows the annualized weather normalized billing units for the test year from Schedule SS-G2. The second column shows present Delivery rates (without Sales and Use Tax, SUT) effective November 1, 2023. The commodity rates in the second column reflect class-weighted averages for the test year from SS-G11. The third column presents annualized revenue for the test period assuming all customers are provided service under their applicable BGSS provision. The fourth column repeats the billing units of the first column. The fifth column shows the proposed rates that result in the proposed revenues shown in column six (6). Columns seven (7) and eight (8) show the proposed revenue increase, in thousands of dollars and percent increase, respectively, for each of the billing unit blocks.

THE BRATTLE GROUP

December 29, 2023
P-10

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
AHMAD FARUQUI
PRINCIPAL EMERITUS - THE BRATTLE GROUP

Q. What is your name?

A. Ahmad Faruqui.

Q. What is your affiliation?

A. I am a Principal Emeritus with The Brattle Group.

Q. What are your qualifications?

A. I am an economist by training and have advised utilities, regulatory bodies, governments and legislative councils on all six continents. My CV is appended as Schedule AF-1.

Q. What is the topic of your testimony?

A. I am testifying in support of PSE&G's application for developing new time-of-use (TOU) rates for residential customers.

Q. What issues will you address in your testimony?

A. In my testimony, I provide the rationale for why TOU rates are more desirable than flat or inclining block rates, followed by a national overview of the state of TOU deployment. Then, I explain how PSE&G developed its TOU rates and discuss how it intends to deploy them.

Q. Why should rates be aligned with cost causation?

A. Cost causation is one of the fundamental tenets of rate design. It helps to promote economic efficiency and also promotes equity. It's mentioned in Professor Bonbright's widely cited text on public utility regulation.

Q. Why are TOU rates better aligned with cost causation than flat rates or inclining block rates?

A. Consumers don't consume the same amount of electricity around the clock. Electricity consumption varies by day, by month, and by season. In summer peaking utilities, air conditioning load creates a pattern of use that rises with temperature. Often, loads begin to rise in the afternoon and linger on into the evening hours. Load shapes are also driven by customer lifestyles. Since electricity cannot yet be stored in sufficient quantities, extra generation capacity has to be kept in reserve to meet peak loads. It stays idle most of the time and is expensive to install and operate. With flat rates, consumers have no incentive to conserve electricity during peak hours and to use more during off-peak hours. TOU rates provide customers an incentive to reduce peak load and to shift it to off-peak hours.

Q. What is the status of TOU rates in the US?

A. According to the US Energy Information Administration (EIA)[1], as of the year 2022, 380 utilities were offering time-varying rates including TOU rates and dynamic pricing rates to their residential customers. There were 13.1 million customers on these rates, representing 9% of all customers in the nation. However, it's worth noting that the average participant rate is skewed upwards by a few utilities. Nearly 60% of investor-owned utilities offering TOU rates have enrollment rates of less than 1% while some 15% of utilities have participation rates that exceed

[1] Annual Electric Power Industry Report, Form EIA-861, accessed at https://www.eia.gov/electricity/data/eia861/.

15%. Reasons for low enrollment at utilities include poor marketing of the TOU rate, inconvenient design (i.e., long peak period), and/or additional charges to cover the cost of an interval meter (where smart metering has not been deployed).

One of the primary reasons why TOU rate offerings are going up is the widespread deployment of smart meters. According to EIA[2], U.S. electric utilities had about 111 million advanced smart metering infrastructure (AMI) installations, representing 80% of all residential electric customers in 2021.

Q. How many pricing periods are typically to be found in a TOU rate?

A. About two-thirds of the utilities offer TOU rates with two periods and the remaining one-third offer TOU rates with three or more periods.

Q. What is the ratio of peak to off-peak prices in TOU rates?

A. According to the OpenEI database,[3] 85% of TOU rates have a price ratio greater than 2-to-1, with the mean value being 3-to-1. The mean differential between peak and off-peak rates is 12 cents/kWh. TOU rates with three periods have a similar price ratio as those with two period TOU rates and a similar differential.

Q. Based on your experience working with a wide range of utilities in the US and abroad and your review of the literature, why do utilities offer TOU rates?

A. In my view, the foremost reason why utilities offer TOU rates is to help customers manage their energy bills. Customers want choice and offering a TOU rate to them in addition to the existing rate (which could be flat or have an inclining block structure) accommodates that desire.

[2] US Energy Information Administration, accessed at https://www.eia.gov/tools/faqs/faq.php?id=108&t=3#:~:text=In%202021%2C%20U.S.%20electric%20utilities,electric%20meters%20were%20AMI%20meters.
[3] Utility Rate Database, accessed at https://openei.org/wiki/Utility_Rate_Database.

TOU rates encourage customers to shift their load away from the peak period and helps reduce costs for all customers over the long run. They also encourage off-peak usage which enhances the affordability of newly emerging, climate-friendly technologies, such as electric vehicles (EVs). Well-designed TOU rates represent a win-win situation for customers and their utilities.

Q. What is the typical duration of the peak period?

A. For a long time, utilities developed the duration of the peak period based on a review of prices in the wholesale market. The peak hours used to be 16 hours long and did not appeal to customers. Newer TOU rates, primarily designed to appeal to EV drivers, have much shorter peak periods, typically ranging from 4 to 6 hours. Peak periods used to cover the early afternoon hours, such as noon to 6 pm. Now they occur much later in the afternoon, and often range from 4 pm to 9 pm.

Q. How are the pricing periods developed?

A. Utilities typically develop pricing periods by reviewing recent data on annual hourly load shapes for system marginal costs and annual hourly load shapes for the system as a whole. Sometimes, they also review annual hourly load shapes for the residential class.

Q. How are prices developed by period?

A. Utilities typically develop them by reviewing hourly marginal energy costs and capacity costs for supply (capacity, energy, transmission and distribution). In this proceeding, PSE&G is only proposing changes in the distribution portion of rates. Since customers pay a single amount that includes generation, transmission and distribution, we have developed illustrative rates that include all these components. It's my understanding that the final version of TOU rates will be developed in future Basic Generation Service ("BGS") proceedings.

Q. Are system costs based on embedded or marginal costs?

A. In nearly every case that I am aware of, utilities base their rates on an embedded cost of service study. TOU rates are designed to be revenue-neutral for the class as a whole. Thus, a customer whose load shape resembles that of the class as a whole will see no change in their bill unless they change their load shape. If they lower their peak load and/or shift it to the off-peak period, they will realize bill savings. Peakier-than-average customers will see higher bills unless they reduce their peak load. Customers who are less peaky than the class average will realize immediate savings by choosing a TOU rate and if they lower their peak load, will realize even higher savings.

In a few cases, utilities also review a marginal cost of service study. However, these are only used to determine the ratio between peak and off-peak period charges. The absolute values are still based on an embedded cost of service study.[4]

Q. What are the different ways in which utilities deploy TOU rates to customers?

A. There are three modes of deployment: opt-in, opt-out and mandatory. Opt-in means the rate is offered to all customers. Any customer who wants to take it can sign up for it. Those customers who don't take the optional rate stay on their existing rate. Opt-out means that all customers are rolled over to the rate but any customer who does not want to stay on it can opt-out to another rate, which may be the prior rate or a new rate. Mandatory means that all customers are rolled over to the TOU rate and they have no choice. In Michigan, which has moved all customers to a default TOU rate, customers do have a choice to switch to other rates but they are also TOU rates.

[4] This method of developing rate is also called the equiproportional marginal cost method.

Q. How many TOU rates are deployed on an opt-in basis?

A. Most TOU deployments are on an opt-in basis.

Q. How many TOU rates are deployed on an opt-out basis?

A. In the US, California and Colorado have rolled out TOU rates as the default rate. In California, this was first done by a municipal utility, SMUD, which serves more than half a million customers in Sacramento and surrounding areas. It was then followed by all three large investor-owned utilities which serve 12 million customers. In Canada, the province of Ontario with some four million customers has rolled out TOU rates but they only apply to the energy portion of the rate.

Q. How many TOU rates are deployed on a mandatory basis?

A. The first utility to deploy TOU rates on a mandatory basis was Fort Collins, which serves nearly 69,000 customers. In Michigan, the two large investor-owned utilities, Consumers Energy and DTE, have deployed a TOU rate as the default and given customers a choice to opt-out to other TOU rates.

Q. Are pilots a pre-requisite for deploying TOU rates?

A. No. There have been scores of pilots around the US and many others around the globe. Utilities can safely proceed with offering opt-in TOU rates based on the experiences of other utilities, supplemented with insights gathered by conducting focus groups with their own customers. However, default and mandatory deployments should ideally be preceded by pilots. That has been the case in California, Colorado and Michigan.

Q. Is seasonal variation often found in TOU rates?

A. Yes, it's quite common, particularly in utilities where system load shapes vary across the seasons because of climatic factors, and this causes variation in the cost of service across seasons.

Q. What are the main features of well-designed TOU rates?

A. Well-designed TOU rates are customer-friendly and have short peak periods. They provide customers with an opportunity to save money by shifting their usage during the peak period to off-peak periods. Utilities provide videos on their web portal to educate customers on how they benefit by reducing peak loads and shifting energy consumption to the off-peak period. They often provide a bill calculator that allows customers to find the lowest cost rate that is consistent with their lifestyle. A single individual may have a different lifestyle than a young couple with no children or a family with young children or empty nesters.

Q. How can customers take advantage of TOU rates?

A. The penetration of EVs is growing fast. EVs are often the biggest load in a customer's house. Customers with EVs can set them to charge after midnight, when electricity costs are lowest. Customers with central air conditioning can precool their homes during the off-peak period by lowering their thermostat by a couple of degrees and raising it by a couple of degrees during the peak period. These days, most homes have programmable thermostats that make this a relatively easy task. Since central air conditioning is a big load in the house, this can yield substantial savings by itself. They can do their laundry during the off-peak hours. In addition, they can set the delay button on their dishwasher so it runs after midnight, which usually falls within the off-peak period.

Q. What utilities have successfully deployed opt-in TOU rates?

A. OGE in Oklahoma and APS and SRP in Arizona have successfully recruited large numbers of customers to TOU rates for years. They offer a choice of several TOU rates to their customers. In the past few years, utilities in Georgia, Missouri and New York have begun offering similarly well-designed rates to their customers on an opt-in basis. For additional details on the status of TOU rates in the US, please consult Schedule AF-2.

Q. Why is PSE&G planning to deploy TOU rates?

A. The primary purpose is to better reflect the cost of service. As noted earlier, this will promote economic efficiency and equity. There is a national trend toward TOU rates. This is being driven by a desire to combat climate change via electrification of buildings and transportation, and to manage the cost and operational challenges of that transition. EV deployment is rising fast. It's going to be potentially the biggest user of electricity in homes. Unless customers charge their EVs during off-peak and night time periods, they will end up creating a serious challenge to the grid. With TOU rates, they will be able to lower their charging costs and also reduce the strain on the grid. Of course, as noted earlier, smart meters are a pre-requisite to the widespread deployment of TOU rates.

Additionally, the Residential TOU Program meets PSE&G's commitment set forth in the BPU's CEF-EV Order to address rates for residential EV charging.[5]

Q. What specific TOU rates is PSE&G planning to deploy?

A. PSE&G is planning to offer two TOU rates to its residential customers. One TOU rate is going to be a two-period rate that modifies the existing Residential Load Management ("RLM")

[5] CEF-EV Order at 13 (Stipulation of Settlement, paragraph 33).

rate by shortening the peak period and enhancing the discount during the off-peak period. The other TOU rate will be a three-period TOU rate with a specially discounted night time rate to encourage night-time charging of EVs.

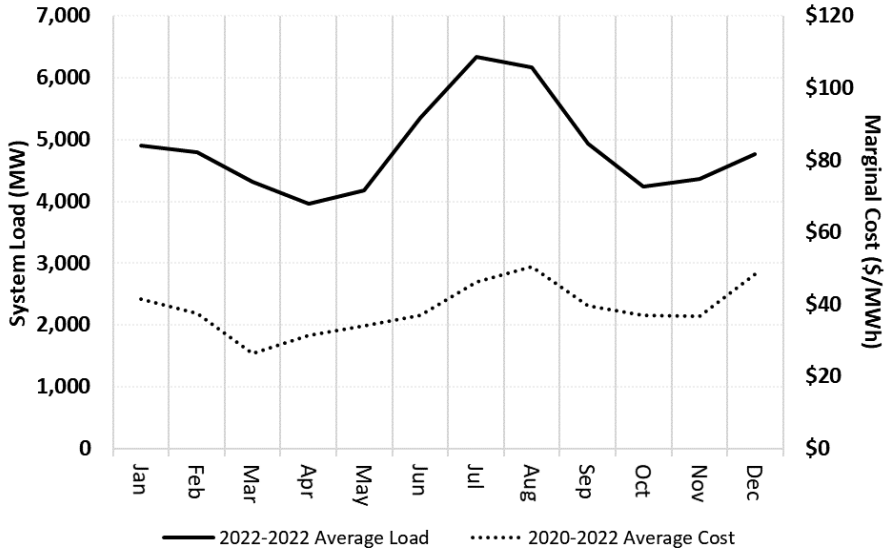
Q. Why is more than one TOU rate being offered?

A. To give customers choice, especially to those who drive EVs.

Q. How were they developed?

A. PSE&G is proposing to develop TOU rates focused on distribution costs in this proceeding. In a later filing, it will develop TOU rates focused on generation energy and capacity costs, transmission costs and all other costs. However, since customers pay a total bill, and not a separate distribution bill, in this testimony I have developed all-in TOU rates. We developed TOU pricing periods by reviewing data on hourly system load shapes, and hourly system marginal costs (equal to Day Ahead Locational Marginal Pricing ("LMPs")). These are summarized in Figure 1. System loads are shown on the vertical axis on the left and marginal costs on the vertical axis on the right.

Figure 1 Average System Load and Marginal Cost by Month (2020-2022)



The figure shows two distinct patterns across the year: winter and summer. Winter has eight months, which goes from October through December and January through May. Summer has four months, from June through September. This also aligns with PSE&G's gas season definition.

Figure 2 Typical Summer Weekday Profile (2020-2022)

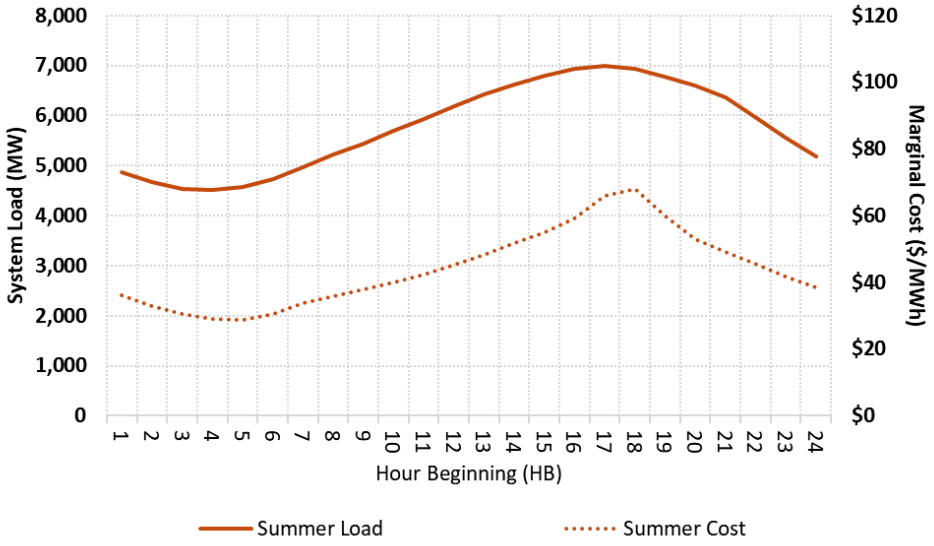


Figure 3 Typical Winter Weekday Profile (2020-2022)

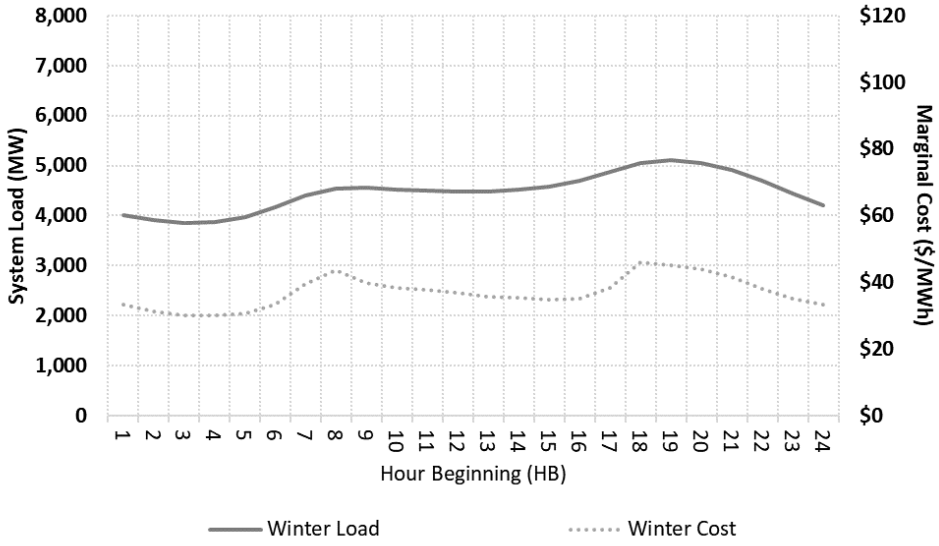

Winter features bimodal peaks with pronounced evening peak while summer features one pronounced evening peak. For simplicity and better customer experience, we propose adopting the

same pricing period definitions for all seasons. The two-period TOU rate will have an on-peak time period that runs from 4 P.M. to 9 P.M. (EST) Monday through Friday, which is significantly shorter than the peak period in the existing TOU rate, and very much in line with the newer generation of TOU rates that are being offered in the US.[6] The three-period TOU rate will have the same on-peak period as the two-period TOU rate and will run from 4 P.M. to 9 P.M. (EST) Monday through Friday. In addition, it will have an off-peak period from 12 A.M. to 6 A.M. (EST) in all days that should appeal to EV drivers. All other hours shall constitute the Mid-Peak period.

Q. How did you design the two-period TOU rate?

A. The TOU rates were developed in close concert with Stephen Swetz of PSE&G and were designed to be revenue neutral with the RS rate class. As a starting point, Witness Swetz used PSE&G's embedded cost study for the Residential ("RS"), to develop TOU distribution rates. We designed generation rates to be revenue neutral to current the current RS default generation rates or Basic Generation Service ("BGS") RS rates. We used the Day-Ahead LMPs from PJM as a proxy for the marginal energy cost of generation. For other generation costs, we used costs that were used to develop BGS rates, then adjusted the results to ensure revenue neutrality. We designed transmission rates to be revenue neutral to the RS transmission rates but set rates to recover costs via certain TOU rate periods to better align with cost causation.

For the two-period TOU rate, we first calculated the summer and non-summer peak rates to reflect the generation, transmission, and distribution capacity and the generation energy costs. We allocated the remaining costs (net of revenue from peak hours and revenue from fixed

[6] The definition of current RLM on-peak period is 7 A.M. to 9 P.M. (EST) Monday through Friday during Daylight Savings Time. All other hours are considered as off-peak period.

charges) equally across the off-peak periods, solving for the corresponding rates to ensure revenue neutrality.

The current RS rate varies by season. It also has two tiers in it. Under PSE&G's rate proposal, the average residential customer on the RS rate would pay 22 cents/kWh in the summer and 17 cents/kWh in the winter months. This reflects an increase of 18% in summer and an increase of 7% in winter compared to the current RS rate. Both rates are shown in the figure below.

Figure 4 Summary of Current and Proposed RS Rate

		Current RS Rate		Proposed RS Rate	
		Summer	**Winter**	**Summer**	**Winter**
Generation ($/kWh)	0-600	$0.077023	$0.080531	$0.077023	$0.080531
	Over 600	$0.086772		$0.086772	
Distribution ($/kWh)	0-600	$0.047449	$0.035553	$0.081585	$0.047785
	Over 600	$0.051523		$0.085659	
Transmission ($k/kWh)		$0.061233	$0.061233	$0.061233	$0.061233
Average Total Rate ($/kWh)		**$0.187680**	**$0.160734**	**$0.221816**	**$0.171218**
Monthly Charge ($/Month)		$4.95		$8.05	

Figure 5 Summary of Proposed Two-Period TOU Rate

	Two Period TOU			
	Summer		**Winter**	
	On Peak	**Off Peak**	**On Peak**	**Off Peak**
Generation ($/kWh)	$0.127337	$0.065788	$0.131136	$0.072600
Transmission ($/kWh)	$0.139700	$0.052704	$0.069850	$0.052704
Distribution ($/kWh)	$0.209513	$0.037114	$0.153778	$0.037114
Final Rate ($/kWh)	**$0.476551**	**$0.155605**	**$0.354764**	**$0.162418**
Monthly Charge ($/Month)	$8.05			

Under PSE&G's rate proposal, under the two-period rate, the average residential customer would pay a rate of 48 cents/kWh during the peak period and a rate of 16 cents/kWh during the off-peak

period in the summer; in the winter, the corresponding values would be 35 cents/kWh during the peak period and a rate of 16 cents/kWh during the off-peak period.

Q. Why did you design a three-period TOU rate in addition to a two-period TOU rate?

A. The three-period TOU rate is primarily designed to appeal to PSE&G's customers that drive EVs but all residential customers would be eligible to sign up for it.

Q. How did you design the three-period TOU rates?

A. Our methodology is similar to that of the two-period TOU rate. Like the two-period TOU rate, the three-period TOU rate is also revenue neutral, meaning that it collects the same amount of revenue for the class, before any load shifting.

Figure 6 Summary of Proposed Three-Period TOU Rate

	Three Period TOU					
	Summer			Winter		
	On Peak	Mid Peak	Off Peak	On Peak	Mid Peak	Off Peak
Generation ($/kWh)	$0.127337	$0.070636	$0.048759	$0.131136	$0.075768	$0.063677
Transmission ($/kWh)	$0.139700	$0.069850	-	$0.069850	$0.069850	-
Distribution ($/kWh)	$0.209513	$0.042307	$0.021153	$0.153778	$0.042307	$0.021153
Final Rate ($/kWh)	**$0.476551**	**$0.182794**	**$0.069912**	**$0.354764**	**$0.187925**	**$0.084830**
Monthly Charge ($/Month)			$8.05			

Under the three-period rate, the average residential customer would pay a rate of 48 cents/kWh during the peak period, which is the same as the peak period price in the two-period TOU rate; a rate of 18 cents/kWh during the mid-peak period, and a rate of 7 cents/kWh during the off-peak period in the summer. In the winter, the corresponding values would be 35 cents/kWh during the peak period, 19 cents/kWh during the mid-peak period and 8 cents/kWh during the off-peak period. The figures below provide graphical illustrations of the rate.

Figure 7 Graphic Illustration of Two-Period TOU Rates (Summer)

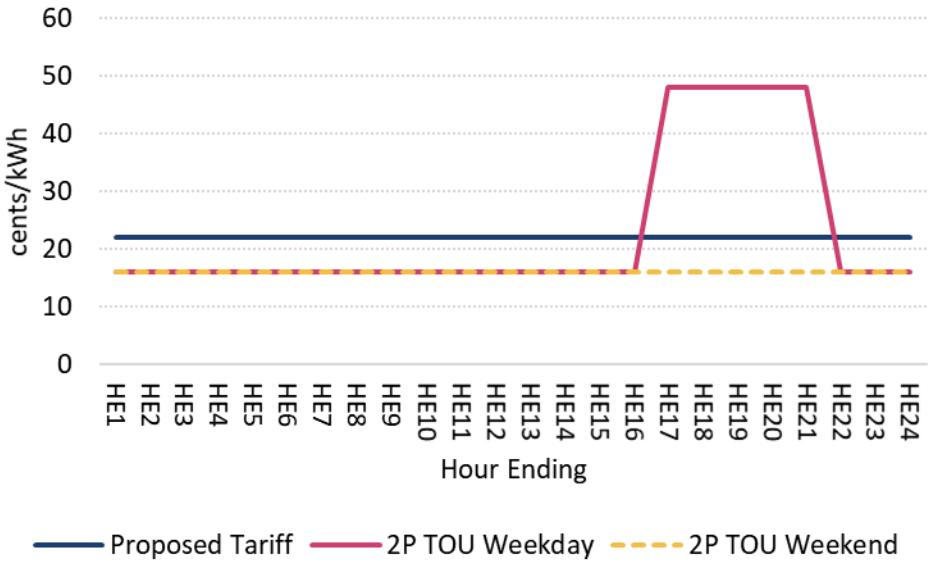

Figure 8 Graphic Illustration of Three-Period TOU Rates (Summer)

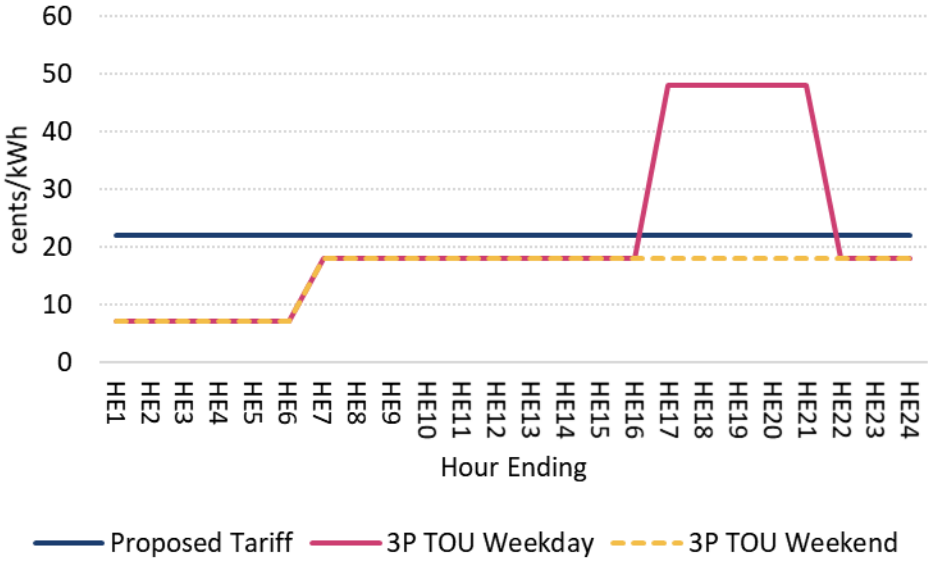

Q. How do the proposed TOU rates compare with those being offered by other utilities?

A. Structurally, they are quite similar. Since California has the largest number of customers on TOU rates, and since it also has the largest number of customers with EVs, I have compared PSE&G's rates with those being offered by PG&E, one of the two largest investor-owned utilities

in the state. It serves some 5 million electric customers in northern California and has a long history of offering TOU rates. It is also the utility which serves my personal residence.

Figure 9 shows the two-period TOU rates for the utilities and Figure 10 shows the three-period TOU rates. Structurally, the TOU rates are similar but since the average rate levels differ significantly for the two utilities (approximately 22 cents/kWh for PSE&G and approximately 38 cents/kWh for PG&E), PSE&G's customers are always going to be paying less per kWh than PG&E's customers.

Figure 9: Comparison of PSE&G's Two-Period TOU rate with PG&E's

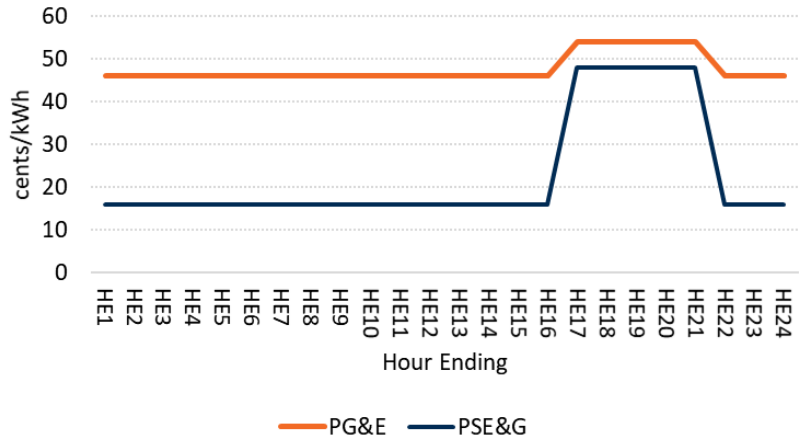

Figure 10: Comparison of PSE&G's Three-Period TOU rate with PG&E's

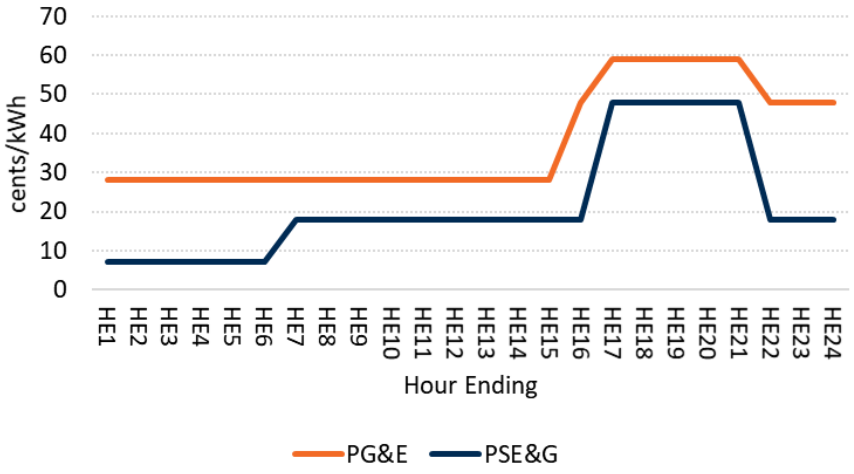

Q. Will the pricing periods in the TOU rates change at some point in the future?

A. Yes, they may change in the future if significant changes take place in the time pattern of system loads and system marginal energy and capacity costs. Such changes have occurred in utilities that have had TOU rates in place for decades. I have been on PG&E's TOU rates since the early 1990's. Back then, the on-peak period ran from noon to 6 pm. A decade or two later, it was changed and ran from 2 pm to 7 pm. Now it runs from 4 pm to 9 pm.

Q. Will the levels of the TOU rates change over time?

A. Yes, they may also change over time as significant changes take place in energy and capacity costs by time period.

Q. Are the rates designed to be revenue-neutral for the residential class?

A. Yes, they are. I have estimated the impact of the TOU rates on the average customer in a sample of 170 customers that was provided to me by PSE&G. The results are shown below in Figures 11 and 12, first for the two-period TOU rate, then for the three-period TOU rate. In the figures, positive numbers indicate bill savings and negative numbers indicate bill increases.

Figure 11 Average Bill Impact – Two-Period TOU

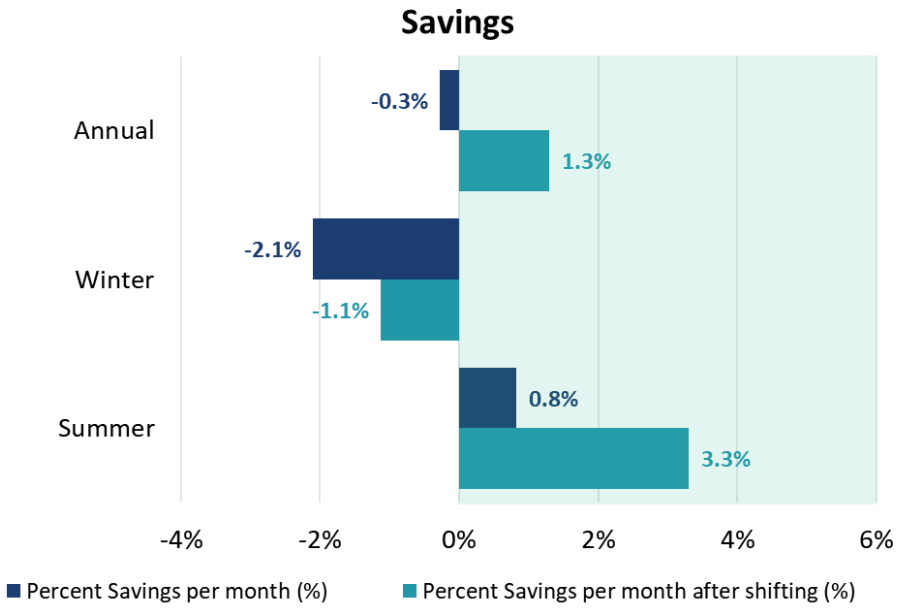

Figure 12 Average Bill Impact – Three-Period TOU

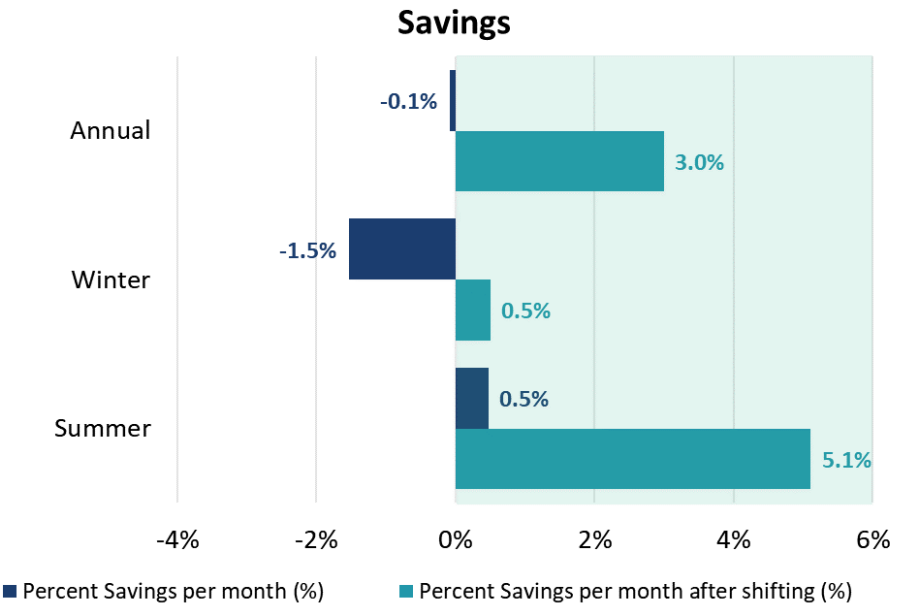

Q. What will be the likely impact of the TOU rates on customer bills?

A. Working with the sample of 170 customers, I estimated how each customer's bill will change if they were to move from the RS to each of the two TOU rates. For each rate, I rank

ordered the bill impacts by customer so that the biggest drop in bills occur to the left of the chart and the highest rise in bills occur to the right of the chart. This creates the "propeller charts" that are shown below in Figures 13 and 14. These charts show how the two TOU rates will affect customer bills before they engage in any load shifting. Approximately half of the customers save money simply by switching to the TOU rates, even in the absence of load shifting: 49% in the case of the two-period rate and 48% in the case of the three-period rate.

Figure 13 Monthly Bill Impact on Sample Customers (Two Period TOU, without load shifting)

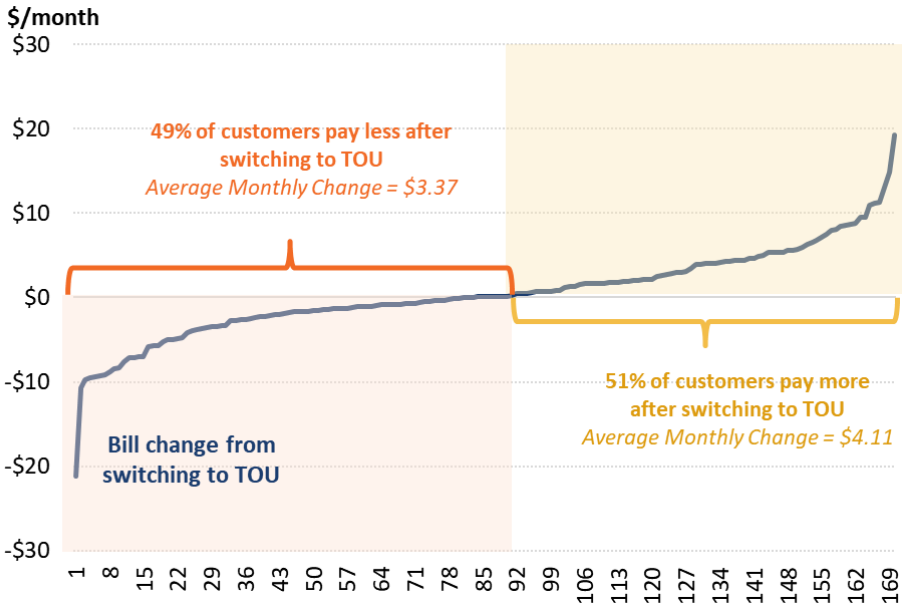

Figure 14 Monthly Bill Impact on Sample Customers (Three Period TOU, without load shifting)

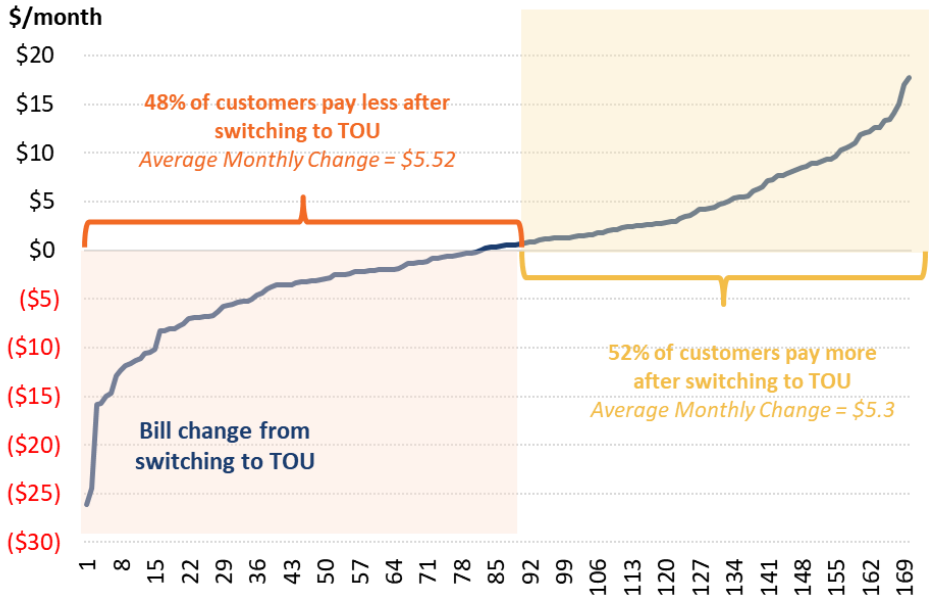

Q. How strong is the incentive to shift loads away from the peak period?

A. Strong price signals exist for shifting load away from the peak period in both the two-period and the three-period TOU rates. For the two-period TOU rate, the peak to off-peak price ratio is about 3.1:1 to one in summer months, and 2.2:1 for non-summer months. The three-period TOU rate has an even stronger price signal, with a 6.8:1 price ratio during the summer months between on-peak and off-peak period.

Figure 15 Summary of the On-Peak to Off-Peak Ratio

		Residential 2P TOU	Residential 3P TOU
Summer			
On-Peak	$/kWh	$0.476551	$0.476551
Mid-Peak	$/kWh	-	$0.182794
Off-Peak	$/kWh	$0.155605	$0.069912
Winter			
On-Peak	$/kWh	$0.354764	$0.354764
Mid-Peak	$/kWh	-	$0.187925
Off-Peak	$/kWh	$0.162418	$0.084830
On-Peak : (Mid-Peak): Off-Peak Ratios			
Summer		3.1 :1	6.8 :2.6 :1
Winter		2.2 :1	4.2 :2.2 :1

Q. As a result of the price incentives offered by these two TOU rates, how much will customers lower their peak demand?

A. Customers will have a strong incentive to reduce their peak loads in response to these two TOU rates and to shift that load to the non-peak periods. Using the analytical charts in Arcturus, a Brattle database that contains a meta-analysis of results from more than 400 deployments of time-varying rates around the globe, I would expect to see the following pattern of results for the two TOU rates.[7] In the summer, the two-period TOU rate would induce a drop of 10% in peak load and a drop of 7% in the winter. As for the three-period TOU rate, in the summer it would induce a drop of 16% in peak load and a drop of 12% in the winter.

[7] For the purposes of this analysis, the model is developed based on 127 observations that are Time-of-Use rate and opt-in deployment from the Arcturus database. For background on Arcturus, please consult: https://www.brattle.com/wp-content/uploads/2023/02/Do-Customers-Respond-to-Time-Varying-Rates-A-Preview-of-Arcturus-3.0.pdf.

Figure 16 The Arc of Price Responsiveness – Two-Period TOU

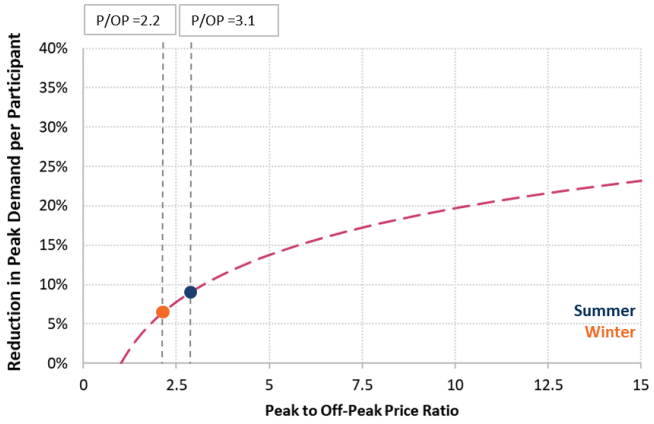

Figure 17 The Arc of Price Responsiveness – Three-Period TOU

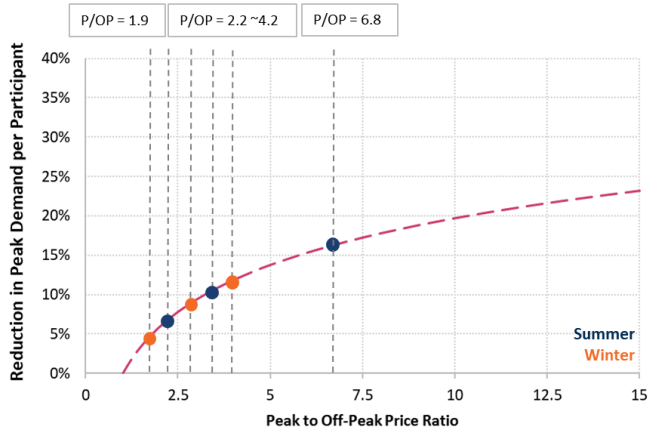

Q. When customers respond to TOU rates by reducing their peak loads, will their bills go down?

A. Yes, I would expect them to go down as they shift their usage from a costlier period to the less costly off-peak period in the case of the two-period TOU rate and to the less-costlier mid-peak and off-peak periods in the case of the three-period TOU rate. The propeller charts which include the effect of load shifting away from the peak period are shown below. They show that a greater percentage of customers will see lower bills than the results shown in the previous figures which assumed no load shifting. For the two-period rate, 69% of customers save money, compared to

49% in the absence of load shifting. For the three-period rate, 80% save money, compared to 48% in the absence of load shifting.

Figure 18 Monthly Bill Impact on Sample Customers (Two Period TOU, with load shifting)

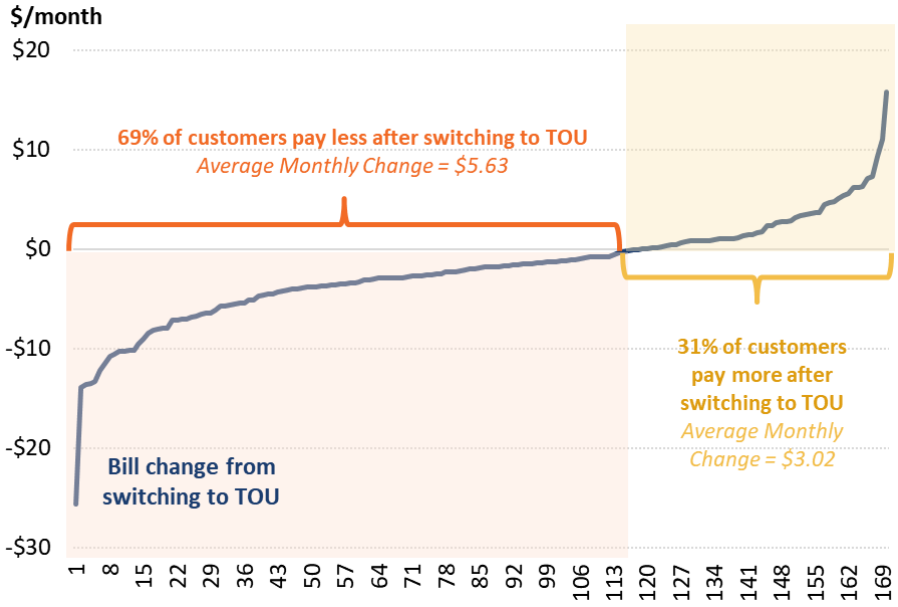

Figure 19 Monthly Bill Impact on Sample Customers (Three Period TOU, with load shifting)

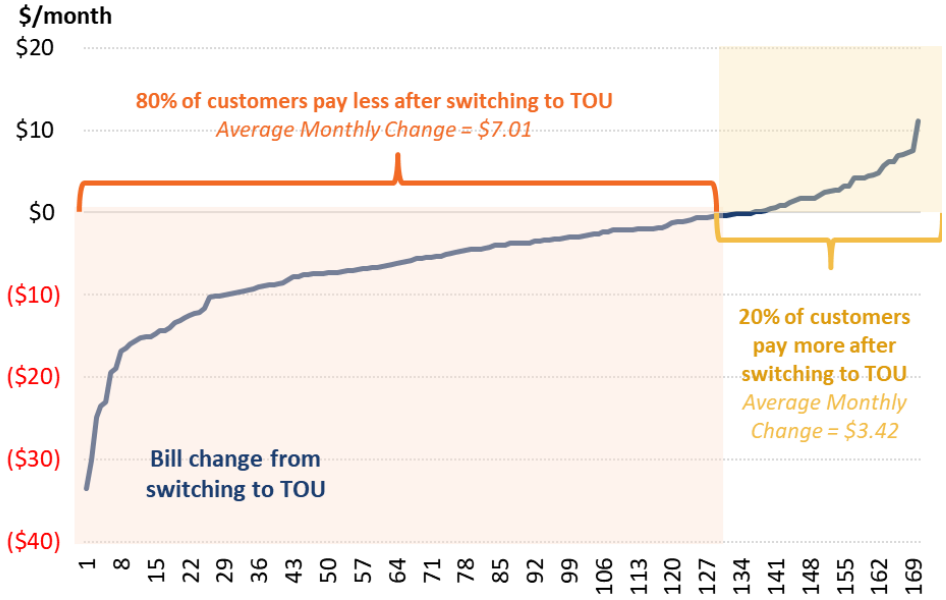

Q. Will any customer be harmed by switching to TOU rates?

A. No. PSE&G will provide bill protection for the first year that a customer is on a TOU rate. They will not see a bill increase. If their bill goes down, they will get to keep the savings. Also, if they don't like the TOU rate for any reason, they will be able to opt-out of it. Additionally, PSE&G will provide ideas on its web portal to help customers modify their pattern of consuming energy to maximize their bill savings.

Q. What is your general assessment of the two TOU rates that PSE&G is proposing to offer its residential customers?

A. PSE&G's TOU rates recognize that customers have diverse tastes and preferences. Some customers want simplicity in their tariffs, others value comfort, while others want to closely monitor their usage and lower their bills by changing the way they consume energy. PSE&G will continue to offer its existing RS Rate Schedule as the default residential rate. The two TOU tariffs will be complementary to the RS Rate Schedule. They will appeal to customers who want to lower their bills by reducing their usage during the peak period and shifting it to the off-peak period.

Q. What is your opinion of the two-period TOU rate?

A. The rate features a discount of 17% compared to the existing tariff in the off-peak period, and a premium of 155% compared to the price in the on-peak period in summer. Customers who are able to shift energy consumption from the on-peak period (which is 5 hours long) to the off-period (which is 19 hours long) in the summer will save 67% on each kWh that is shifted in summer and 54% on each kWh in winter. In my opinion, this rate will appeal to those customers who are able to shift significant end use loads from the on-peak to the off-peak period. For example, they could load their dishes in the dishwasher and set its timer to start operating at 9 p.m. They could program their thermostat so it's a few degrees lower during the off-peak hours in the summer

months. If their normal setting is 74 degrees, they could raise it to 75 degrees during the on-peak hours and lower it to 73 degrees during the off-peak hours. The greater the differential in the temperature setting between the off-peak and on-peak periods, the more they will save.

Q. What is your opinion of the three-period TOU rate?

A. This rate features three pricing periods to provide a greater discount during the night time. Based on what I have observed in other jurisdictions where three-period TOU rates are being offered, it should appeal to customers who drive electric vehicles (EVs). They can simply set the timer in their cars to charge the battery during the off-peak hours. Most EVs can be fully charged in six hours and most drivers don't always fully charge their EVs. For each summer kWh shifted from the on-peak to the off-peak period, they will save 85%. For each summer kWh they shift from the on-peak to the mid-peak period, they will save 62%. For winter, the percentage savings are 76% and 47% from the on-peak to the off-peak and mid-peak period, respectively. In my opinion, this rate will appeal to customers who are seriously interested in saving money by moving significant portions of their load out of the on-peak period to the mid-peak and off-peak periods. This rate exemplifies the trends in modern rate designs: allowing customers to create significant savings opportunities by lowering demand when the grid is stressed. This would help PSE&G keep rates lower for customers in the long run by avoiding the need to invest in distribution infrastructure upgrades to meet higher peak demands.

Q. Is a shorter peak period likely to attract more customers than a longer peak period?

A. Yes. A shorter peak period is easier for customers to cope with than a longer peak period. Another advantage of the shorter peak period is that the price differential between on-peak and off-peak hours can be higher than with a longer peak period. Customers would save more for each kWh that is reduced and/or shifted to the off-peak period. In sum, a shorter on-peak period is easier

for customers to cope with and also more rewarding. Thus, I would expect it to attract more customers.

Q. Should the TOU rate structure stay constant or change over time?

A. Over time, I would expect system load shapes and costs to change, due to changes in the mix of generation resources and in the manner that customers use electricity, driven by the increasing penetration of EVs and distributed energy resources, such as solar panels and battery storage. As such changes occur, the rate structure should change which may involve changing the duration of the pricing periods as well as the prices within the periods. However, the rates should not be changed every year.

Q. What is the optimal frequency for changing rates?

A. In my view, rate structures and parameters should not be changed too frequently to prevent customer confusion and frustration. Ideally, the structure of the rates and its key parameters should be kept constant over a five-year period. Of course, the price levels in each period may change during this period to reflect changes in the cost of service, market prices and other factors. But the price ratios and period definitions should not be changed too frequently.

Q. Would you expect the proposed TOU rates to be well received by customers?

A. Yes, I would. Customers are likely to appreciate being given more choices to lower their bills by making slight modifications in their lifestyle. All of them will have an opportunity to try out the new TOU rates and see if they can lower their bills. They will have bill protection for the first year, and will only pay the lower of the TOU bill or the bill they would have paid with the standard rate. If are not able to lower their bill, they will have the option to get off the TOU rate at the end of their initial 12 month period.

Q. Does that conclude your testimony?

A. Yes.

Ahmad Faruqui

PRINCIPAL EMERITUS

San Francisco | +1.925.408.0149 | ahmadfaruqui@gmail.com

Dr. Faruqui is an energy economist whose consulting practice encompasses rate design, demand response, distributed energy resources, demand forecasting, decarbonization, electrification and energy efficiency and load flexibility.

In his career, Dr. Faruqui has advised some 150 clients in 12 countries on 5 continents and appeared before regulatory bodies, governments, and legislative councils in Alberta (Canada), Arizona, Arkansas, California, Colorado, Connecticut, Delaware, District of Columbia, Egypt, FERC, Georgia, Illinois, Indiana, Iowa, Jamaica, Kansas, Kentucky, Michigan, Maryland, Minnesota, Missouri, Nevada, New Brunswick (Canada), Nova Scotia (Canada), Ohio, Oklahoma, Ontario (Canada), Pennsylvania, the Philippines, Saudi Arabia (ECRA), Texas, and Washington.

He has authored or coauthored more than 150 papers in peer-reviewed and trade journals and co-edited 5 books on industrial structural change, customer choice, and electricity pricing. His innovations have been cited in *Bloomberg*, *Businessweek*, *The Economist*, *Forbes*, and *National Geographic*, in addition to news outlets including the *Los Angeles Times*, *The New York Times*, *San Francisco Chronicle*, *San Jose Mercury News*, and *The Washington Post*. He has also appeared on Fox Business News and NPR.

He has taught economics at San Jose State University, the University of California, Davis, and the University of Karachi and delivered guest lectures at Carnegie Mellon, Harvard, Idaho, MIT, New York University, Northwestern, Rutgers, Stanford, UC Berkeley, and UC Davis. He has also given seminars on energy issues on 20 countries on 6 continents.

AREAS OF EXPERTISE

- Regulatory Economics, Finance, & Rates
- Electricity Wholesale Markets & Planning

EDUCATION

- **University of California, Davis**
  PhD in Economics
  MA in Agricultural Economics
- **University of Karachi (Karachi, Pakistan)**
  MA in Economics (Highest Honors)
  BA in Economics, with minors in Mathematics, & Statistics (Highest Honors)

PROFESSIONAL EXPERIENCE

- **The Brattle Group (2006–Present)**
  Principal Emeritus (2021–Present)
  Principal (2006–2021)

EXPERT TESTIMONY

UNITED STATES

Arizona

- Rebuttal Testimony before the Arizona Corporation Commission on behalf of Arizona Public Service Company, in the matter of Stacey Champion, et al., v Arizona Public Service Corporation, Docket No. E-01345A-18-0002, August 17, 2018.
- Direct Testimony before the Arizona Corporation Commission on behalf of Arizona Public Service Company, in the matter of Stacey Champion, et al., v Arizona Public Service Corporation, Docket No. E-01345A-18-0002, July 31, 2018.
- Direct Testimony before the Arizona Corporation Commission on behalf of Arizona Public Service Company, in the matter of the Application of Arizona Public Service Company for a Hearing to Determine the Fair Value of the Utility Property of the Company for Ratemaking Purposes, to Fix a Just and Reasonable Rate of Return Thereon, to Approve Rate Schedules Designed To Develop Such Return, Docket No. E-01345A-16-0036, June 1, 2016.
- Direct Testimony before the Arizona Corporation Commission on behalf of Arizona Public Service Company, in the matter of the Application for UNS Electric, Inc. for the Establishment of Just and Reasonable Rates and Charges Designed to Realize a Reasonable Rate of Return on the Fair Value of the Properties of UNS Electric, Inc. Devoted to the its

Operations Throughout the State of Arizona, and for Related Approvals, Docket No. E-04204A-15-0142, December 9, 2015.

- Testimony before the Board of Directors on behalf of Salt River Project, in the matter of "An Evaluation of SRP's Electric Rate Proposal for Residential Customers with Distributed Generation," December 31, 2014.

Arkansas

- Direct Testimony before the Arkansas Public Service Commission on behalf of Entergy Arkansas, Inc., in the matter of Entergy Arkansas, Inc.'s Application for an Order Finding the Deployment of Advanced Metering Infrastructure to be in the Public Interest and Exemption from Certain Applicable Rules, Docket No. 16-060-U, September 19, 2016.

California

- Prepared testimony before the California Public Utilities Commission on behalf of Bloom Energy Corporation, Application R.20-11-003, September 10, 2021.
- Testimony before the Board of Directors on behalf of SMUD, in the matter of "Encouraging Rooftop Solar without Creating Cross-subsidies," April 30, 2019.
- Rebuttal Testimony before the Public Utilities Commission of the State of California, Pacific Gas and Electric Company Joint Utility on Demand Elasticity and Conservation Impacts of Investor-Owned Utility Proposals, in the Matter of Rulemaking 12-06-013, October 17, 2014.
- Prepared testimony before the Public Utilities Commission of the State of California on behalf of Pacific Gas and Electric Company on rate relief, Docket No. A.10-03-014, Summer 2010.
- Qualifications and prepared testimony before the Public Utilities Commission of the State of California, on behalf of Southern California Edison, Edison SmartConnect™ Deployment Funding and Cost Recovery, exhibit SCE-4, July 31, 2007.
- Testimony on behalf of the Pacific Gas & Electric Company, in its application for Automated Metering Infrastructure with the California Public Utilities Commission. Docket No. 05-06-028, 2006.

Colorado

- Rebuttal testimony before the Public Utilities Commission of the State of Colorado in the Matter of Advice Letter No. 1535 by Public Service Company of Colorado to Revise its

Colorado PUC No.7 Electric Tariff to Reflect Revised Rates and Rate Schedules to be Effective on June 5, 2009. Docket No. 09al-299e, November 25, 2009.

- Direct testimony before the Public Utilities Commission of the State of Colorado, on behalf of Public Service Company of Colorado, on the tariff sheets filed by Public Service Company of Colorado with advice letter No. 1535 – Electric. Docket No. 09S-__E, May 1, 2009.

Connecticut

- Testimony before the Department of Public Utility Control, on behalf of the Connecticut Light and Power Company, in its application to implement Time-of-Use, Interruptible Load Response, and Seasonal Rates- Submittal of Metering and Rate Pilot Results- Compliance Order No. 4, Docket no. 05-10-03RE01, 2007.

District of Columbia

- Direct testimony before the Public Service Commission of the District of Columbia on behalf of Potomac Electric Power Company in the matter of the Application of Potomac Electric Power Company for Authorization to Establish a Demand Side Management Surcharge and an Advance Metering Infrastructure Surcharge and to Establish a DSM Collaborative and an AMI Advisory Group, case no. 1056, May 2009.

Georgia

- Direct testimony before the State of Georgia Public Service Commission on behalf of Georgia Power Company, in the matter of Georgia Power Company's 2019 Base Rate Case, Docket No. 42516, June 28, 2019.

Idaho

- Rebuttal Testimony before the Idaho Public Utilities Commission on behalf of Idaho Power Company (Idaho Power), in the matter of the Application of Idaho Power Company for Authority to Establish New Schedules for Residential and Small General Service Customers with On-Site Generation, Case No. IPC-E-17-13, January 26, 2018.

Illinois

- Direct testimony on rehearing before the Illinois Commerce Commission on behalf of Ameren Illinois Company, on the Smart Grid Advanced Metering Infrastructure Deployment Plan, Docket No. 12-0244, June 28, 2012.

- Testimony before the Illinois Commerce Commission on behalf of Commonwealth Edison Company regarding the evaluation of experimental residential real-time pricing program, 11-0546, April 2012.
- Rebuttal Testimony before the Illinois Commerce Commission on behalf of Commonwealth Edison Company in the matter of the Petition to Approve an Advanced Metering Infrastructure Pilot Program and Associated Tariffs, No. 09-0263, August 14, 2009.
- Prepared rebuttal testimony before the Illinois Commerce Commission on behalf of Commonwealth Edison, on the Advanced Metering Infrastructure Pilot Program, ICC Docket No. 06-0617, October 30, 2006.

Indiana

- Direct testimony before the State of Indiana, Indiana Utility Regulatory Commission, on behalf of Vectren South, on the smart grid. Cause no. 43810, 2009.

Kansas

- Rebuttal testimony before the State Corporation Commission of the State of Kansas on behalf of Evergy Kansas Central, Inc. and Evergy Kansas South, Inc. in the matter of the Joint Application of Westar Energy, Inc. and Kansas Gas and Electric Company to Make Certain Changes in Their Charges for Electric Services, Docket No. 18-WSEE-328-RTS, December 04, 2020.
- Direct testimony before the State Corporation Commission of the State of Kansas on behalf of Evergy Kansas Central, Inc. and Evergy Kansas South, Inc. in the matter of the Joint Application of Westar Energy, Inc. and Kansas Gas and Electric Company to Make Certain Changes in Their Charges for Electric Services, Docket No. 18-WSEE-328-RTS, October 13, 2020.
- Rebuttal testimony before the State Corporation Commission of the State of Kansas, on behalf of Westar Energy, in the matter of the Joint Application of Westar Energy, Inc. and Kansas Gas and Electric Company for Approval to Make Certain Changes in their Charges for Electric Services, Docket No. 18-WSEE-328-RTS, July 3, 2018.
- Direct testimony before the State Corporation Commission of the State of Kansas, on behalf of Westar Energy, in the matter of the Joint Application of Westar Energy, Inc. and Kansas Gas and Electric Company for Approval to Make Certain Changes in their Charges for Electric Services, Docket No. 18-WSEE-328-RTS, February 1, 2018.

- Reply affidavit before the State Corporation Commission of the State of Kansas, on behalf of Westar Energy, in the matter of the General Investigation to Examine Issues Surrounding Rate Design for Distributed Generation Customers, Docket No. 16-GIME-403-GIE, May 5, 2017.
- Direct testimony before the State Corporation Commission of the State of Kansas, on behalf of Westar Energy, in the matter of the Application of Westar Energy, Inc. and Kansas Gas and Electric Company to Make Certain Changes in Their Charges for Electric Service, Docket No. 15-WSEE-115-RTS, March 2, 2015.

Louisiana

- Rebuttal testimony before the Council of the City of New Orleans on behalf of Entergy New Orleans, LLC, in the matter of Application of Entergy New Orleans, LLC for a Change in Electric and Gas Rates Pursuant to Council Resolutions R-15-194 and R-17-504 and for Related Relief, Docket No. UD-18-07, March 2019.
- Direct testimony before the Council for the City of New Orleans on behalf of Entergy New Orleans, LLC, in the matter of Application of Entergy New Orleans, LLC for a Change in Electric and Gas Rates Pursuant to Council Resolutions R-15-194 and R-17-504 and for Related Relief, Docket No. UD-18-07, July 2018.
- Direct testimony before the Louisiana Public Service Commission on behalf of Entergy Louisiana, LLC, in the matter of Approval to Implement a Permanent Advanced Metering System and Request for Cost Recovery and Related Relief in accordance with Louisiana Public Service Commission General Order dated September 22, 2009, R-29213, November 2016.
- Direct testimony before the Council of the City of New Orleans, on behalf of Entergy New Orleans, Inc., in the matter of the Application of Energy New Orleans, Inc. for Approval to Deploy Advanced Metering Infrastructure, and Request for Cost Recovery and Related Relief, October 2016.

Maryland

- Direct Testimony before the Maryland Public Service Commission, on behalf of Potomac Electric Power Company in the matter of the Application of Potomac Electric Power Company for Adjustments to its Retail Rates for the Distribution of Electric Energy, April 19, 2016.

- Rebuttal Testimony before the Maryland Public Service Commission on behalf of Baltimore Gas and Electric Company in the matter of the Application of Baltimore Gas and Electric Company for Adjustments to its Electric and Gas Base Rates, Case No. 9406, March 4, 2016.
- Direct testimony before the Public Service Commission of Maryland, on behalf of Potomac Electric Power Company and Delmarva Power and Light Company, on the deployment of Advanced Meter Infrastructure. Case no. 9207, September 2009.
- Prepared direct testimony before the Maryland Public Service Commission, on behalf of Baltimore Gas and Electric Company, on the findings of BGE's Smart Energy Pricing ("SEP") Pilot program. Case No. 9208, July 10, 2009.

Minnesota

- Rebuttal testimony before the Minnesota Public Utilities Commission State of Minnesota on behalf of Northern States Power Company, doing business as Xcel Energy, in the matter of the Application of Northern States Power Company for Authority to Increase Rates for Electric Service in Minnesota, Docket No. E002/GR-12-961, March 25, 2013.
- Direct testimony before the Minnesota Public Utilities Commission State of Minnesota on behalf of Northern States Power Company, doing business as Xcel Energy, in the matter of the Application of Northern States Power Company for Authority to Increase Rates for Electric Service in Minnesota, Docket No. E002/GR-12-961, November 2, 2012.

Mississippi

- Direct testimony before the Mississippi Public Service Commission, on behalf of Entergy Mississippi, Inc., in the matter of Application for Approval of Advanced Metering Infrastructure and Related Modernization Improvements, EC-123-0082-00, November 2016.

Missouri

- Direct testimony before the Missouri Public Service Commission, on behalf of Union Electric Company d/b/a Ameren Missouri, in the matter of Union Electric Company d/b/a Ameren Missouri's Tariffs to Increase Its Revenues for Electric Service, ER-2019-0335, July 3, 2019.

Montana

- Rebuttal testimony before the Public Service Commission of the State of Montana on behalf of NorthWestern Energy, in the matter of NorthWestern Energy's Application for Authority to Increase Retail Electric Utility Service Rates and for Approval of Electric Service Schedules and Rules and Allocated Cost of Service and Rate Design, Docket No. D2018.2.12, April 2019.

- Prefiled direct testimony before the Public Service Commission of the State of Montana on behalf of NorthWestern Energy, in the matter of NorthWestern Energy's Application for Authority to Increase its Retail Electric Utility Service Rates and for Approval of its Electric Service Schedules and Rules, Docket No. D2018.2.12, September 28, 2018.

Nevada

- Prepared rebuttal testimony before the Public Utilities Commission of Nevada on behalf of Nevada Power Company and Sierra Pacific Power Company d/b/a NV Energy, in the matter of net metering and distributed generation cost of service and tariff design, Docket Nos. 15-07041 and 15-07042, November 3, 2015.
- Prepared direct testimony before the Public Utilities Commission of Nevada on behalf of Nevada Power Company d/b/a NV Energy, in the matter of the application for approval of a cost of service study and net metering tariffs, Docket No. 15-07, July 31, 2015.

New Mexico

- Direct testimony before the New Mexico Regulation Commission on behalf of Public Service Company of New Mexico in the matter of the Application of Public Service Company of New Mexico for Revision of its Retail Electric Rates Pursuant to Advice Notice No. 507, Case No. 14-00332-UT, December 11, 2014.

Oklahoma

- Rebuttal Testimony before the Corporation Commission of Oklahoma on behalf of Oklahoma Gas and Electric Company in the matter of the Application of Oklahoma Gas and Electric Company for an Order of the Commission Authorizing Applicant to modify its Rates, Charges and Tariffs for Retail Electric Service in Oklahoma, Cause No. PUD 201500273, April 11, 2016.
- Direct Testimony before the Corporation Commission of Oklahoma on behalf of Oklahoma Gas and Electric Company in the matter of the Oklahoma Gas and Electric Company for an Order of the Commission Authorizing Applicant to modify its Rates, Charges and Tariffs for Retail Electric Service in Oklahoma, Cause No. PUD 201500273, December 18, 2015.
- Responsive Testimony before the Corporation Commission of Oklahoma on behalf of Oklahoma Gas and Electric Company in the matter of the Application of Brandy L. Wreath, Director of the Public Utility Division, for Determination of the Calculation of Lost Net Revenues and Shared Savings Pursuant to the Demand Program Rider of Oklahoma Gas and Electric Company, Cause No. PUD 201500153, May 13, 2015.

Pennsylvania

- Direct testimony before the Pennsylvania Public Utility Commission, on behalf of PECO on the Methodology Used to Derive Dynamic Pricing Rate Designs, Case no. M-2009-2123944, January 11, 2011.

South Carolina

- Rebuttal Testimony before the Public Service Commission of South Carolina on behalf Duke Energy Carolinas, LLC and Duke Energy Progress, LLC in the matter Duke Energy Carolinas, LLC's Establishment of Solar Choice Metering Tariffs Pursuant to S.C. Code Ann. Section 58-40-20, Febrauray 23, 2021.

Washington

- Pre-filed Direct Testimony before the Washington Utilities and Transportation Commission on Behalf of Puget Sound Energy, Dockets UE-22 and UG-22, January 31, 2022.
- Pre-filed Direct Testimony before the Washington Utilities and Transportation Commission on Behalf of Puget Sound Energy, Dockets UE-151871 and UG-151872, February 25, 2016.

CANADA

Alberta

- Virtual proceedings in front of the Alberta Utilities Commission, Application No. 24116-A001, Proceeding ID No. 24116. June 24, 2020.
- Information Response to Alberta Utilities Commission in Electric Distribution System Inquiry - Combined Module Proceedings ID 24116. June 17, 2020.

British Columbia

- Filed expert report, "Capacity Savings Estimates in BC Hydro's 2021 IRP: An Independent Review" with the British Columbia Utilities Commission (BCUC). February 22, 2022.

New Brunswick

- Presented before the New Brunswick Energy and Utilities Board in the Matter of the Stakeholder recommendations on rate design reform: Matter 357. May 12, 2020.

Nova Scotia

- Presented before the Nova Scotia Utility and Review Board in the Matter of The Public Utlities Act, R. S. N. S. 1989, c380, as amended. Time-Varying Pricing Tariff Application No. M09777. November 20, 2020.
- Presented before the Nova Scotia Utility and Review Board to provide an assessment of Nova Scotia Power, Inc.'s proposed Extra Large Industrial Active Demand Control (ELIADC) tariff for Port Hawkesbury Paper (PHP). February 2020.

REGULATORY APPEARANCES

Arkansas

- Presented before the Arkansas Public Service Commission, "The Emergence of Dynamic Pricing," at the workshop on the Smart Grid, Demand Response, and Automated Metering Infrastructure, Little Rock, Arkansas, September 30, 2009.

Delaware

- Presented before the Delaware Public Service Commission, "The Demand Response Impacts of PHI's Dynamic Pricing Program," Delaware, September 5, 2007.

Kansas

- Presented before the State Corporation Commission of the State of Kansas, "The Impact of Dynamic Pricing on Westar Energy," at the Smart Grid and Energy Storage Roundtable, Topeka, Kansas, September 18, 2009.

Ohio

- Presented before the Ohio Public Utilities Commission, "Dynamic Pricing for Residential and Small C&I Customers," at the Technical Workshop, Columbus, Ohio, March 28, 2012.

Texas

- Presented before the Public Utility Commission of Texas, "Direct Load Control of Residential Air Conditioners in Texas," at the PUCT Open Meeting, Austin, Texas, October 25, 2012.

SELECTED CONSULTING EXPERIENCE

INNOVATIVE PRICING

- **Cost of service and tariff design study**. For a large electric utility in South-East Asia, Brattle provided consulting services for their cost of service and tariff design studies for incentive-based regulation, covering regulatory period 2 (2018–2020). Our work focused on understanding the cost drivers, reviewing the extent to which the current tariffs reflect the cost drivers, and developing new tariffs that better align with current and projected costs.
- **Impact analysis for TOU rates in Ontario.** Measured the impacts of a system-wide Time of Use (TOU) deployment in the province of Ontario, Canada, on behalf of the Ontario Power Authority. To account for the lack of a designated control group, Brattle created a quasi-experimental design that took advantage of differences in the timing of the TOU rollout.
- **Measurement and evaluation for in-home displays, home energy controllers, smart appliances, and alternative rates for Florida Power & Light (FPL).** Carried out a 2-year impact evaluation of a dynamic and enabling technology pilot program. Used econometric methods to estimate the changes in load shapes, changes in peak demand, and changes in energy consumption for three different treatments. The results of this study were shared with Department of Energy to fulfil the data reporting requirements of FPL's Smart Grid Investment Grant.
- **Report examining the costs and benefits of dynamic pricing in the Australian energy market.** For the Australian Energy Market Commission (AEMC), developed a report that reviewed the various forms of dynamic pricing, such as time-of-use pricing, critical peak pricing, peak time rebates, and real-time pricing, for a variety of performance metrics including economic efficiency, equity, bill risk, revenue risk, and risk to vulnerable customers. It also discussed ways in which dynamic pricing could be rolled out in Australia to raise load factors and lower average energy costs for all consumers without harming vulnerable consumers, such as those with low incomes or medical conditions requiring the use of electricity.
- **Whitepaper on emerging issues in innovative pricing.** For the Regulatory Assistance Project (RAP), developed a whitepaper on emerging issues and best practices in innovative rate design and deployment. The paper included an overview of AMI-enabled electricity pricing options, recommendations for designing the rates and conducting experimental pilots, an overview of recent pilots, full-deployment case studies, and a blueprint for rolling out innovative rate designs. The paper's audience was international regulators in regions that were exploring the potential benefits of smart metering and innovative pricing.

- **Assessing the full benefits of real-time pricing.** For two large Midwestern utilities, assessed and, where possible, quantified the potential benefits of the existing residential real-time pricing (RTP) rate offering. The analysis included not only "conventional" benefits such as avoided resource costs, but under the direction of the state regulator, was expanded to include harder-to-quantify benefits such as improvements to national security and customer service.
- **Pricing and technology pilot design and impact evaluation for Connecticut Light & Power (CL&P).** Designed the Plan-It Wise Energy pilot for all classes of customers and subsequently evaluated the Plan-It Wise Energy program (PWEP). PWEP tested the impacts of CPP, PTR, and time of use (TOU) rates on the consumption behaviors of residential and small commercial and industrial customers.
- **Dynamic pricing pilot design and impact evaluation: Baltimore Gas & Electric.** Designed and evaluated the Smart Energy Pricing (SEP) pilot, which ran for four years. The pilot tested a variety of rate designs including critical peak pricing and peak time rebates on residential customer consumption patterns. In addition, the pilot tested the impacts of smart thermostats and the Energy Orb.
- **Impact evaluation of a residential dynamic pricing experiment: Consumers Energy (Michigan).** Designed the pilot and carried out an impact evaluation with the purpose of measuring the impact of critical peak pricing (CPP) and peak time rebates (PTR) on residential customer consumption patterns. The pilot also tested the influence of switches that remotely adjust the duty cycle of central air conditioners.
- **Impact simulation of Ameren Illinois utilities' power smart pricing program.** Simulated the potential demand response of residential customers enrolled in real-time prices. The results of this simulation were presented to the Midwest ISO's Supply Adequacy Working Group (SAWG) to explore alternative ways of introducing price responsive demand in the region.
- **The case for dynamic pricing: Demand Response Research Center.** Led a project involving the California Public Utilities Commission, the California Energy Commission, the state's three investor-owned utilities, and other stakeholders in the rate design process. Identified key issues and barriers associated with the development of time-based rates. Revisited the fundamental objectives of rate design, including efficiency and equity, with a special emphasis on meeting the state's strongly-articulated needs for demand response and energy efficiency. Developed a score-card for evaluating competing rate designs and applied it to a set of illustrative rates that were created for four customer classes using actual utility data. The work was reviewed by a national peer-review panel.

- **Analyzed the economics of self-generation of steam.** Specified, estimated, tested, and validated a large-scale model that analyzes the response of some 2,000 large commercial customers to rising steam prices. The model includes a module for analyzing conservation behavior, another module for the probability of self-generation switching behavior, and a module for forecasting sales and peak demand.
- **Design and impact evaluation of the statewide pricing pilot: Three California utilities.** Working with a consortium of California's three investor-owned utilities to design a statewide pricing pilot to test the efficacy of dynamic pricing options for mass-market customers. The pilot was designed using scientific principles of experimental design and measured changes in usage induced by dynamic pricing for over 2,500 residential and small commercial and industrial customers. The impact evaluation was carried out using state-of-the-art econometric models. Information from the pilot was used by all three utilities in their business cases for advanced metering infrastructure (AMI). The project was conducted through a public process involving the state's two regulatory commissions, the power agency, and several other parties.
- **Economics of dynamic pricing: Two California utilities.** Reviewed a wide range of dynamic pricing options for mass-market customers. Conducted an initial cost-effectiveness analysis and updated the analysis with new estimates of avoided costs and results from a survey of customers that yielded estimates of likely participation rates.
- **Economics of time-of-use pricing: A Pacific Northwest utility.** This utility ran the nation's largest time-of-use pricing pilot program. Assessed the cost-effectiveness of alternative pricing options from a variety of different perspectives. Options included a standard three-part time-of-use rate and a quasi-real time variant where the prices vary by day. Worked with the client in developing a regulatory strategy. Worked later with a collaborative to analyze the program's economics under a variety of scenarios of the market environment.
- **Economics of dynamic pricing options for mass-market customers - Client: A multi-state utility.** Identified a variety of pricing options suited to meet the needs of mass-market customers, and assessed their cost-effectiveness. Options included standard three-part time-of-use rates, critical peak pricing, and extreme-day pricing. Developed plans for implementing a pilot program to obtain primary data on customer acceptance and load shifting potential. Worked with the client in developing a regulatory strategy.
- **Real-time pricing in California - Client: California Energy Commission.** Surveyed the national experience with real-time pricing of electricity, directed at large power customers. Identified lessons learned and reviewed the reasons why California was unable to implement real-time pricing. Cataloged the barriers to implementing real-time pricing in

California, and developed a program of research for mitigating the impacts of these barriers.

- **Market-based pricing of electricity - Client: A large Southern utility.** Reviewed pricing methodologies in a variety of competitive industries including airlines, beverages, and automobiles. Recommended a path that could be used to transition from a regulated utility environment to an open market environment featuring customer choice in both wholesale and retail markets. Held a series of seminars for senior management and their staff on the new methodologies.
- **Tools for electricity pricing - Client: Consortium of several U.S. and foreign utilities.** Developed Product Mix, a software package that uses modern finance theory and econometrics to establish a profit-maximizing menu of pricing products. The products range from the traditional fixed-price product to time-of-use prices to hourly real-time prices, and also include products that can hedge customers' risks based on financial derivatives. Outputs include market share, gross revenues, and profits by product and provider. The calculations are performed using probabilistic simulation, and results are provided as means and standard deviations. Additional results include delta and gamma parameters that can be used for corporate risk management. The software relies on a database of customer load response to various pricing options called StatsBank. This database was created by metering the hourly loads of about one thousand commercial and industrial customers in the United States and the United Kingdom.
- **Risk-based pricing - Client: Midwestern utility.** Developed and tested new pricing products for this utility that allowed it to offer risk management services to its customers. One of the products dealt with weather risk; another one dealt with the risk that real-time prices might peak on a day when the customer does not find it economically viable to cut back operations.

DEMAND RESPONSE

- **Combined heat and power generation study.** Investigated the economic potential for combined heat and power and regulatory policies to unlock that potential in a Middle Eastern country.
- **National action plan for demand response: Federal Energy Regulatory Commission.** Led a consulting team developing a national action plan for demand response (DR). The national action plan outlined the steps that need to be taken in order to maximize the amount of cost-effective DR that can be implemented. The final document was filed with U.S. Congress.

- **National assessment of demand response potential: Federal Energy Regulatory Commission.** Led a team of consultants to assess the economic and achievable potential for demand response programs on a state-by-state basis. The assessment was filed with the U.S. Congress, as required by the Energy Independence and Security Act.
- **Demand response program review for Integrated Resource Plan development.** In response to legislation requiring the Connecticut utilities to jointly prepare a 10-year integrated resource plan, we conducted the analysis and helped prepare the plan. In coordination with the two leading utilities in the state, we conducted a detailed analysis of alternative resource solutions (both supply- and demand-side), drafted the report, and presented it to the Connecticut Energy Advisory Board. The analysis involved a detailed review and critique of the companies' proposed DR programs.
- **Integration of DR into wholesale energy markets.** Developed a whitepaper, "Fostering Economic Demand Response in the Midwest ISO," evaluating alternative approaches to efficiently integrating DR into its energy markets while encouraging increased participation. This work involved interviewing market participants and analyzing several approaches to economic DR regarding economic efficiency, participation rates, operational fit with other ISO rules, and susceptibility to state-level and ISO-level implementation barriers. This work involved an extensive survey of DR programs (qualification criteria, bidding rules, incorporation into market clearing software, measurement and verification, and settlement) in ISO/ Regional Transmission Organization (RTO) markets around the country. The project also required a detailed review of existing DR program tariffs for utilities in the RTO's service territory and development of a matrix for summarizing the various characteristics of these programs.
- **Integration of DR into resource adequacy constructs.** For the Midwest ISO, assisted in developing qualification criteria for DR as a capacity resource (we also developed estimates of likely future contributions of DR to resource adequacy, for use by their transmission planning group). For PJM, as part of our review of its capacity market, we developed recommendations on how to treat DR comparably to generation resources while accounting for the special attributes of DR. Our recommendations addressed product definition, auction rules, and penalty provisions. For the Connecticut utilities in their integrated resource planning, we evaluated future resource needs given various levels of demand response programs.
- **Evaluation of the demand response benefits of advanced metering infrastructure: Mid-Atlantic utility.** Conducted a comprehensive assessment of the benefits of advanced metering infrastructure (AMI) by developing dynamic pricing rates that are enabled by AMI.

The analysis focused on customers in the residential class and commercial and industrial customers under 600 kW load.

- **Estimation of demand response impacts: Major California utility.** Worked with the staff of this electric utility in designing dynamic pricing options for residential and small commercial and industrial customers. These options were designed to promote demand response during critical peak days. The analysis supported the utility's advanced metering infrastructure (AMI) filing with the California Public Utilities Commission. Subsequently, the commission unanimously approved a $1.7 billion plan for rolling out nine million electric and gas meters based in part on this project work.

SMART GRID STRATEGY

- **Development of a smart grid investment roadmap for Vietnamese utilities.** For the five Vietnamese power corporations, developed a roadmap to guide future smart grid investment decisions. The report identified and described the various smart grid investment options, established objectives for smart grid deployment, presented a multi-phase approach to deploying the smart grid, and provided preliminary recommendations regarding the best investment opportunities. Also presented relevant case studies and an assessment of the current state of the Vietnamese power grid. The project involved in-country meetings as well as a stakeholder workshop that was conducted by Brattle staff.
- **Cost-benefit analysis of the smart grid: Rocky mountain utility.** Reviewed the leading studies on the economics of the smart grid and used the findings to assess the likely cost-effectiveness of deploying the smart grid in one geographical location.
- **Modeling benefits of smart grid deployment strategies.** Developed a model for assessing the benefits of smart grid deployment strategies over a long-term (e.g., 20-year) forecast horizon. The model, called iGrid, is used to evaluate seven distinct smart grid programs and technologies (e.g., dynamic pricing, energy storage, PHEVs) against seven key metrics of value (e.g., avoided resource costs, improved reliability).
- **Smart grid strategy in Canada.** The Alberta Utilities Commission (AUC) was charged with responding to a Smart Grid Inquiry issued by the provincial government. Advised the AUC on the smart grid, and what impacts it might have in Alberta.
- **Smart grid deployment analysis for collaborative of utilities.** Adapted the iGrid modeling tool to meet the needs of a collaborative of utilities in the southern U.S. In addition to quantifying the benefits of smart grid programs and technologies (e.g., advanced metering infrastructure deployment and direct load control), the model was used to estimate the costs of installing and implementing each of the smart grid programs and technologies.

- **Development of a smart grid cost-benefit analysis framework.** For the Electric Power Research Institute (EPRI) and the U.S. DOE, contributed to the development of an approach for assessing the costs and benefits of the DOE's smart grid demonstration programs.
- **Analysis of the benefits of increased access to energy consumption information.** For a large technology firm, assessed market opportunities for providing customers with increased access to real-time information regarding their energy consumption patterns. The analysis includes an assessment of deployments of information display technologies and analysis of the potential benefits that are created by deploying these technologies.
- **Developing a plan for integrated smart grid systems.** For a large California utility, helped to develop applications for funding for a project to demonstrate how an integrated smart grid system (including customer-facing technologies) would operate and provide benefits.

DEMAND FORECASTING

- **Electricity sales and peak demand forecasting study.** For a large electric utility in South-East Asia, Brattle provided consulting services that involved assessing the performance of their load forecasting methodology and developing new models that provided more accurate forecasts.
- **Electricity consumption and maximum demand forecasting.** For a medium-sized utility in Asia-Pacific, Brattle provided consulting services on forecasting electricity consumption and maximum demand. Our work focused on analyzing drivers of growth in electricity sales, reviewed model performance, identified best practices and provided recommended approaches for analyzing trends in electricity sales and load forecasting.
- **Forecasting review.** Evaluated and critiqued the process conducted by an Australian utility company's electricity market forecasting, including the forecasting of electricity demand, supply, and price.
- **Comprehensive review of load forecasting methodology.** PJM Interconnection. Conducted a comprehensive review of models for forecasting peak demand and re-estimated new models to validate recommendations. Individual models were developed for 18 transmission zones as well as a model for the RTO system.
- **Analyzed downward trend: Western utility.** Conducted a strategic review of why sales had been lower than forecast in a year when economic activity had been brisk. Developed a forecasting model for identifying what had caused the drop in sales and its results were used in an executive presentation to the utility's board of directors. Also developed a time

series model for more accurately forecasting sales in the near term and this model is now being used for revenue forecasting and budgetary planning.

- **Analyzed why models are under-forecasting: Southwestern utility.** Reviewed the entire suite of load forecasting models, including models for forecasting aggregate system peak demand, electricity consumption per customer by sector and the number of customers by sector. Ran a variety of forecasting experiments to assess both the ex-ante and ex-post accuracy of the models and made several recommendations to senior management.
- **U.S. demand forecast: Edison Electric Institute.** For the U.S. as a whole, developed a base case forecast and several alternative case forecasts of electric energy consumption by end use and sector. Subsequently developed forecasts that were based on EPRI's system of end-use forecasting models. The project was done in close coordination with several utilities and some of the results were published in book form.
- **Developed models for forecasting hourly loads: Merchant generation and trading company.** Using primary data on customer loads, weather conditions, and economic activity, developed models for forecasting hourly loads for residential, commercial, and industrial customers for three utilities in a Midwestern state. The information was used to develop bids into an auction for supplying basic generation services.
- **Gas demand forecasting system - Client: A leading gas marketing and trading company, Texas.** Developed a system for gas nominations for a leading gas marketing company that operated in 23 local distribution company service areas. The system made week-ahead and month-ahead forecasts using advanced forecasting methods. Its objective was to improve the marketing company's profitability by minimizing penalties associated with forecasting errors.

DEMAND-SIDE MANAGEMENT

- **The economics of biofuels.** For a western utility that is facing stringent renewable portfolio standards and that is heavily dependent on imported fossil fuels, carried out a systematic assessment of the technical and economic ability of biofuels to replace fossil fuels.
- **Assessment of demand-side management and rate design options: Large Middle Eastern electric utility.** Prepared an assessment of demand-side management and rate design options for the four operating areas and six market segments. Quantified the potential gains in economic efficiency that would result from such options and identified high priority programs for pilot testing and implementation. Held workshops and seminars for senior management, managers, and staff to explain the methodology, data, results, and policy implications.

- **Likely future impact of demand-side programs on carbon emissions - Client: The Keystone Center.** As part of the Keystone Dialogue on Climate Change, developed scenarios of future demand-side program impacts, and assessed the impact of these programs on carbon emissions. The analysis was carried out at the national level for the U.S. economy, and involved a bottom-up approach involving many different types of programs including dynamic pricing, energy efficiency, and traditional load management.
- **Sustaining energy efficiency services in a restructured market - Client: Southern California Edison.** Helped in the development of a regulatory strategy for implementing energy efficiency strategies in a restructured marketplace. Identified the various players that were likely to operate in a competitive market, such as third-party energy service companies (ESCO's) and utility affiliates. Assessed their objectives, strengths, and weaknesses and recommended a strategy for the client's adoption. This strategy allowed the client to participate in the new market place, contribute to public policy objectives, and not lose market share to new entrants. This strategy has been embraced by a coalition of several organizations involved in the California PUC's working group on public purpose programs.
- **Organizational assessments of capability for energy efficiency - Client: U.S. Agency for International Development, Cairo, Egypt.** Conducted in-depth interviews with senior executives of several energy organizations, including utilities, government agencies, and ministries to determine their goals and capabilities for implementing programs to improve energy end-use efficiency in Egypt. The interviews probed the likely future role of these organizations in a privatized energy market, and were designed to help develop U.S. AID's future funding agenda.
- **Enhancing profitability through energy efficiency services - Client: Jamaica Public Service Company.** Developed a plan for enhancing utility profitability by providing financial incentives to the client utility, and presented it for review and discussion to the utility's senior management and Jamaica's new Office of Utility Regulation. Developed regulatory procedures and legislative language to support the implementation of the plan. Conducted training sessions for the staff of the utility and the regulatory body.

ADVANCED TECHNOLOGY ASSESSMENT

- **Competitive energy and environmental technologies - Clients: Consortium of clients, led by Southern California Edison, included the Los Angeles Department of Water and Power and the California Energy Commission.** Developed a new approach to segmenting the market for electrotechnologies, relying on factors such as type of industry, type of process and end-use application, and product size. Developed a user-friendly system for assessing

the competitiveness of a wide range of electric and gas-fired technologies in more than 100 four-digit SIC code manufacturing industries and 20 commercial businesses. The system includes a database of more than 200 end-use technologies and a model of customer decision making.

- **Market infrastructure of energy-efficient technologies - Client: EPRI**. Reviewed the market infrastructure of five key end-use technologies, and identified ways in which the infrastructure could be improved to increase the penetration of these technologies. Data was obtained through telephone interviews with equipment manufacturers, engineering firms, contractors, and end-use customers

- *Measurement and Verification Principles for Behavior-Based Efficiency Programs*, with Sanem Sergici, prepared for Opower, May 2011. http://files.brattle.com/files/8217_measurement_and_verification_principles_for_behavior-based_efficiency_programs_sergici_faruqui_may_2011.pdf
- *Assessing Ontario's Regulated Price Plan*, with Phil Hanser, Ryan Hledik and Jenny Palmer. Ontario Energy Board, December 8, 2010.
- *Methodological Approach for Estimating the Benefits and Costs of Smart Grid Demonstration Projects*, with R. Lee, S. Bossart, R. Hledik, C. Lamontagne, B. Renz, F. Small,

D. Violette, and D. Walls. Pre-publication draft, prepared for the U. S. Department of Energy, Office of Electricity Delivery and Energy Reliability, the National Energy Technology Laboratory, and the Electric Power Research Institute. Oak Ridge, TN: Oak Ridge National Laboratory, November 28, 2009.

- *Moving Toward Utility-Scale Deployment of Dynamic Pricing in Mass Markets*, with Sanem Sergici and Lisa Wood. Institute for Electric Efficiency, June 2009.
- *Demand-Side Bidding in Wholesale Electricity Markets*. With Robert Earle. Australian Energy Market Commission, 2008. https://www.aemc.gov.au/sites/default/files/content/a2f43d16-f48f-4983-8776-9bc1dd71de65/Report-on-Demand-Side-Bidding-in-Wholesale-Electricity-Markets-by-The-Brattle-Group.pdf
- *Assessment of Achievable Potential for Energy Efficiency and Demand Response in the U.S. (2010-2030)*. With Ingrid Rohmund, Greg Wikler, Omar Siddiqui, and Rick Tempchin. American Council for an Energy-Efficient Economy, 2008.
- *Quantifying the Benefits of Dynamic Pricing in the Mass Market*. With Lisa Wood. Edison Electric Institute, January 2008.
- California Energy Commission. *2007 Integrated Energy Policy Report*, CEC-100-2007-008-CMF.
- *Applications of Dynamic Pricing in Developing and Emerging Economies*. Prepared for The World Bank, Washington, DC. May 2005.
- *Preventing Electrical Shocks: What Ontario—And Other Provinces—Should Learn About Smart Metering*. With Stephen S. George. C. D. Howe Institute Commentary, No. 210, April 2005.
- *Primer on Demand-Side Management*. Prepared for The World Bank, Washington, DC. March 21, 2005.
- *Electricity Pricing: Lessons from the Front.* With Dan Violette. White Paper based on the May 2003 AESP/EPRI Pricing Conference, Chicago, Illinois, EPRI Technical Update 1002223, December 2003.
- *Electric Technologies for Gas Compression*. Electric Power Research Institute, 1997.
- *Electrotechnologies for Multifamily Housing.* With Omar Siddiqui. EPRI TR-106442, Volumes 1 and 2. Electric Power Research Institute, September 1996.
- *Opportunities for Energy Efficiency in the Texas Industrial Sector.* Texas Sustainable Energy Development Council. With J. W. Zarnikau et al. June 1995.

- *Principles and Practice of Demand-Side Management*. With John H. Chamberlin. EPRI TR-102556. Palo Alto: Electric Power Research Institute, August 1993.
- *EPRI Urban Initiative: 1992 Workshop Proceedings (Part I).* The EPRI Community Initiative. With G.A. Wikler and R.H. Manson. TR-102394. Palo Alto: Electric Power Research Institute, May 1993.
- *Practical Applications of Forecasting Under Uncertainty.* With K.P. Seiden and C.A. Sabo.TR-102394. Palo Alto: Electric Power Research Institute, December 1992.
- *Improving the Marketing Infrastructure of Efficient Technologies: A Case Study Approach.* With S.S. Shaffer. EPRI TR- I 0 1 454. Palo Alto: Electric Power Research Institute, December 1992.
- *Customer Response to Rate Options.* With J. H. Chamberlin, S.S. Shaffer, K.P. Seiden, and S.A. Blanc. CU-7131. Palo Alto: Electric Power Research Institute (EPRI), January 1991.

PRESENTATIONS & SPEAKING ENGAGEMENTS

- "Utilities Need to Modernize their Tariffs to Enhance the Customer Experience: A National Perspective," presented to the 21st Century Energy Policy Task Force, Indiana, October 1, 2020.
- "Are Consumers Upending the Utility Business Model?" presented at the Florence School of Regulation, September 9, 2020.
- "Designing Tariffs for Tomorrow's Customer: The Innovation Imperative," presented to the Electricity Authority, September 2, 2020.
- "Designing Pilots and Proceeding with Full Scale Deployment," presented at the Washington Utilities and Transportation Commission, June 8, 2020.
- "The Five "Immortal Objections" to Time-of-Use Rates," presented at the PLMA Load Management Dialogue, May 28, 2020.
- " Stakeholder recommendations on rate design reform: Matter 357," with Cecile Bourbonnais, presented at the New Brunswick Energy and Utilities Board, May 12, 2020.
- "Moving Ahead with Time-Varying Rates (TVR): US and Global Perspectives," presented at the MI Power Grid: Energy Programs and Technology Pilots Stakeholder Meeting, April 16, 2020.
- "Moving Ahead with Time-Varying Rates (TVR): US and Global Perspective," presented to the NARUC Staff Subcommittee on Rate Design, April 6, 2020.

- "Demand on Demand," presented at the AESP Annual Conference, February 20, 2020.
- "Empirical Assessment of the Demand for Residential Solar Distributed Generation and the Impact of Electricity Rate Design Reform," with Agustin J. Ros and Cecile Bourbonnais, presented at the Rutgers University Center for Research in Regulated Industries, January 17, 2020.
- "Assessment of APS's Bill Comparison Web Tool: Methodology and Findings," with Ryan Hledik and Cecile Bourbonnais, December 10, 2019.
- "A Survey of Residential Time-of-Use (TOU) Rates," with Ryan Hledik and Sanem Sergici, November 12, 2019.
- "Advancing the Practice of Rate Design," presented at the 40th PLMA Conference, November 6, 2019.
- "The Total Value Test (TVT) for Assessing Electrification Programs," with Ryan Hledik and Omar Siddiqui, presented at the California Efficiency + Demand Management Council (CEDMC), October 24, 2019.
- "A Conversation about Customer Centricity," presented at Virtual Speaker Forum, October 21, 2019.
- "Encouraging Rooftop Solar without Creating Cross-Subsidies," presented to SMUD, April 30, 2019.
- "Post-Modern Rate Design: The 'Secret Sauce' in Customer Engagement," presented at the Entergy Regulatory Conference, April 9, 2019.
- "Valuing and Compensating Distributed Energy Resources in ERCOT," with Ira Shavel and Yingxia Yang, prepared for the Texas Clean Energy Coalition, March 28, 2019.
- "2040: A Pricing Odyssey," presented at the EEI Spring Rates and Regulatory Affairs Committee Meeting, March 25, 2019.
- "Reinventing Demand Response for the Age of Renewable Energy," with Ryan Hledik, December 14, 2018.
- "Enabling Grid Modernization through Alternative Rates and Alternative Regulation," with Sanem Sergici and William P. Zarakas, presented at the Energy Policy Roundtable in the PJM Footprint, November 29, 2018.
- "Modernizing Distribution Tariffs for Households," presented to the Energy Consumers Association in Sydney, Australia, November 9, 2018.

- "The State of Electric Vehicle Home Charging Rates," with Ryan Hledik and John Higham, presented to Colorado PUC, October 2018.
- "Rate Design to Enable Flexible Loads," with Mariko Geronimo Aydin, presented at APPA Business & Financial Conference 2018, September 18, 2018.
- "Customer-driven Rate Design is the Wave of the Future," presented at the Colorado Rural Electric Association Managers Association Meeting, September 10, 2018.
- "Understanding the Costs and Benefits of Electrification: Electrification Cost-Benefit Case Studies," presented at the Electric Power Research Institute (EPRI) Electrification 2018 International Conference & Exposition, August 23, 2018.
- "Do Load Shapes of PV Customers Differ From Other Customers?" with Walter Graf, Presented at the Center for Research in Regulated Industries (CRRI) 31st Annual Western Conference, June 28, 2018.
- "Tariffs of the Future for Gas Utilities," with Léa Grausz, Henna Trewn, and Cecile Bourbonnais, presented at the Center for Research in Regulated Industries (CRRI) 31st Annual Western Conference, June 28, 2018.
- "Collecting Allowed Revenues When Demand is Declining," with Henna Trewn and Léa Grausz, presented at the Center for Research in Regulated Industries (CRRI) 31st Annual Western Conference, June 28, 2018.
- "Incentivizing the Adoption of Gas-Fueled Emerging Technologies with Pricing Tools," with Léa Grausz, presented at the 27th World Gas Conference, June 25, 2018.
- "Estimating the Impact of Innovative Rate Designs," presented to Southern California Edison, June 7, 2018.
- "Rate Design 3.0 and The Efficient Pricing Frontier," presented at the EUCI 2018 Residential Demand Charges Conference, Nashville, TN, May 15, 2018.
- "Does Dynamic Pricing of Electricity Eliminate the Need for Demand Charges?" presented at the Harvard Electricity Policy Group's (HEPG) 89th Plenary Session, January 25, 2018.
- "Dynamic Pricing: What Can We Learn from Other Jurisdictions?" presented at the California Public Utilities Commission's (CPUC) Electric Rate Forum, December 12, 2017.
- "Demand Charges and Dynamic Pricing Are Complements, Not Substitutes," presented at the California Public Utilities Commission's (CPUC) Electric Rate Forum, December 11, 2017.

- "Dynamic Pricing Works in a Hot and Humid Climate: Evidence from Florida," with Sanem Sergici and Neil Lessem, presented at the International Energy Policy & Programme Evaluation Conference, November 2, 2017.
- "A Hybrid Model for Forecasting Electricity Sales and Peak Demand: A Case Study of TNB in Malaysia," with Sanem Sergici and Neil Lessem, presented at the International Energy Policy & Programme Evaluation Conference, November 2, 2017.

SELECTED HONORS & AWARDS

2023	ESIG Excellence Award
2020	*Who's Who Legal*: Energy Experts
1990–2020	Association of Energy Services Professionals (AESP): Recognized as one of seven individuals who was a game changer in the profession during the past 30 years
1976–77	Regents' Fellowship, The University of California at Davis
1977–78	Dissertation Grant, Kellogg Foundation
1973	Overseas Doctoral Scholarship, Government of Pakistan
1973	Rashid Minhas Gold Medal in Economics, University of Karachi

*Forthcoming chapter**, Handbook on Electricity Regulation,** edited by Jean-Michel Glachant, Paul Joskow and Michael Pollitt.*

Time Varying Rates (TVRs) are moving from the periphery to the mainstream of electricity pricing for residential customers in the United States

Ahmad Faruqui and Ziyi Tang[1]

"There's never been any lack of interest in the subject of electricity tariffs. Like all charges upon the consumer, they are an unfailing source of annoyance to those who pay, and an argument among those who levy them… There is general agreement that appropriate tariffs are essential to any rapid development of electricity supply and there is complete disagreement as to what constitutes an appropriate tariff."

D. J. Bolton[2]

Electric tariffs for residential customers[3] through the 1960's were almost entirely volumetric rate designs expressed in cents per kWh. Often, the energy charge dropped with usage, making it a declining block rate.

In those days, the provision of electricity followed a declining cost curve and rates reflected that phenomenon. In the early 1950's, Lewis Strauss, chair of the US Atomic Energy Commission, had famously said the day would come when electricity would be too cheap to meter.[4]

That day never came. Instead, rate shock arrived when OPEC imposed an oil embargo which followed the Yom Kippur War of 1973. It was further amplified when the Iranian Revolution occurred in 1979. In November 1978, the Public Utilities Regulatory Policies Act (PURPA) was passed.[5] It made energy conservation a priority. Load management of electric loads was expanded to include time-of-use (TOU) pricing. A few states in the Mid-Atlantic region decided to make these rates mandatory for very large customers. One state provided incentives for customers to install thermal energy storage equipment and to pair it with a TOU rate.[6] In addition, 16 pilots with TOU rates were launched by the Federal Energy Administration (FEA). They were dispersed throughout the US and included the territory of Puerto Rico.

These pilots received widespread attention. Their results were evaluated by the Research Triangle Institute in North Carolina. At the behest of the National Association of Regulatory Utility Commissioners (NARUC), the Electric Power Research Institute (EPRI) launched the Electric Utility Rate Design Study (EURDS) in 1976. Among other topics, it reviewed and summarized the results of the FEA pilots.[7] Later, EPRI combined the data from the five best pilots and published a meta-analysis.[8]

[8] Douglas W. Caves, Laurits R. Christensen, and Joseph A. Herriges (1984).

Lack of interval metering posed a major barrier to TOU pricing. So did the consistent opposition of consumer advocates. They favored flat volumetric rates. As an in-between measure, inclining block rates were introduced.

In the 1980's, Demand-Side Management (DSM) was spread throughout the US.[9] DSM included utility energy efficiency programs and government codes and standards to promote energy efficiency and load management. Tariff reform took a back seat.[10]

To offset rising bills, retail choice became a priority in the 1990s. It succeeded with large commercial and industrial customers but made little headway with households.

TOU rates languished in the US until California's energy crisis of 2000-01. Soon thereafter, TVR including TOU rates and newly introduced dynamic pricing garnered interest. Dynamic pricing included critical-peak pricing (CPP) and real-time pricing (RTP). In this chapter, TOU rates and dynamic pricing rates are called time-varying rates (TVR).

A second generation of TOU pilots was carried out, initially in California[11], and later in Connecticut, Florida, Illinois Maryland and Michigan.[12] Simultaneously, smart meters began to be rolled out.

Today, 104 million smart meters are deployed at US households, representing 73 % of all residential meters. TVR are finally getting significant attention. In 2022, 9.4% of households were on TOU rates, more than double the percentage in 2018, which had not changed much since 2013. If the trend continues, some 25-35% of households may be on TOU rates by 2030.

This chapter is organized as follows:

Section 1: Evolution of TVR

Section 2: Lessons Learned from Four Decades of Deploying TVR

Section 3: Strategies for Rate Modernization

Section 4: What's Likely to Happen in the Future?

Section 5: Conclusions

Section 1: The Evolution of TVR

With rare exceptions, electric rates for households in the US did not feature time variation until the 1960's.[13] The preferred medium for managing peak loads was direct load control of water heaters and central air conditioners.

[9] Clark W. Gellings and John H. Chamberlin (1993).

[13] European countries were ahead of the US. See, e.g., Christophe Aubin, Denis Fougère, Emmanuel Husson, and Marc Ivaldi (1995) and F. M. Westfield (1980) and Valerie Lesgards et Edouard Rossat (2022).

Since the conclusion of the landmark Madison Gas and Electric Company case of August 1974, commissions, utilities, and intervenors began studying the desirability and feasibility of implementing TOU rates. In 1978, PURPA required commissions to consider and make a determination regarding the cost-effectiveness of TOU rates, which were accorded the status of a federal rate-making standard.

To address these issues, the FEA, a precursor to the Department of Energy, worked with several states and Puerto Rico to conduct pilots with TOU rates. The pilots represented the first of many waves that would follow and their designs were of uneven quality.[14] Even then, they showed that customers lowered their on-peak usage by curtailing it and/or shifting it to off-peak periods, thereby improving load factor and lowering costs.

Between the late seventies and the mid-eighties, EURDS went through four phases and published nearly a hundred reports. In its second phase, EURDS was directed by a Project Committee comprised of commissioners and utility vice presidents. At one point, it was headed by Professor Alfred Kahn, who chaired the New York Public Service Commission while on leave from Cornell University.[15]

In an interview with the EPRI Journal, he was quite vocal about the merits of TVR: "Never mind whether you want to go to incremental-cost pricing or stick with historical-average pricing. You should at least have time-of-consumption rates; rates that differ, reflecting the fact that, even historically, the costs of installing more capacity should not be put on people who consume off peak. They are not responsible for construction of that capacity. It is indisputable that the costs imposed on a system, if only the generating costs are different when you consume at peak on a hot summer day or you consume in the middle of the night-so that truly cost-based rates cannot avoid varying consumption, logically."[16]

J. Robert Malko, an economist from the Wisconsin Commission, managed EURDS.[17] Several advisory committees drawn from commissions and utilities guided the work of the EURDS. The utility staff were drawn from investor-owned utilities, municipal utilities and cooperatives.

The EURDS advisers agreed that TOU rates should be cost reflective, in accordance with the widely accepted Bonbright principles.[18] However, there was little agreement on whether they should be based on marginal or embedded costs. The majority supported basing rates on embedded costs, a practice that continues to this day.[19]

In the eighties, there was universal agreement that a big barrier to implementing TOU rates was the absence of interval metering. In the years that followed, a few utilities went ahead and installed interval meters. A few, especially in California, deployed TOU rates on a mandatory basis for their large commercial and industrial customers.

Figure 1 shows the evolution of TVR and how it interacted with other driving factors.

First wave

Across the 16 pilots that were implemented, the short-run effects of TOU rates on customer electricity usage were encouraging but inconsistent. In most cases, customers materially reduced peak consumption in response to the TOU rates, with very little (if any) load-shifting to shoulder or off-peak periods. The reduction in peak consumption was statistically significant in many pilots.[20] The FEA found that higher peak-to-off-peak price ratios and shorter on-peak periods generally led to stronger customer response. However, these experiments did not test customer responses in the long run.

The industry mostly put the idea of TOU implementation on hold.

Second wave

The second wave began in the mid-1980s, when EPRI examined the results from five of the best designed FEA pilots and found consistent evidence of consumer behavior.[21] Unfortunately, not much came of this discovery because of the lack of smart metering infrastructure and because of the industry's focus on retail restructuring and the expansion of wholesale electricity markets. However, a few utilities did move ahead with mandatory TOU rates for large residential customers. Virtually all utilities moved ahead with opt-in TOU rates, but few customers took those rates.

In a related development, also in the 1980s, Bob Noyce, founder of Intel, and Mike Markkula, founder of Apple Computer invested in a startup company founded by Bill Uhr. These technology investors saw a major market opportunity in Uhr's microprocessor-based integrated thermal storage system that provided cooling, heating, and hot water for a 2500 square-foot home. Twelve pilots monitored by Virgina Power demonstrated that the systems could reduce the winter peak total house load by up to 90% and summer peak by up to 70%. Using TOU rates, the homeowners could save 25% to 35% on their annual electric bill. Notwithstanding the pilot success and serious interest by home builders, the company was unable to move into production due to the lack of utility support.

[20] Ahmad Faruqui and J. Robert Malko (1983).

[21] Douglas W. Caves, Laurits R. Christensen, and Joseph A. Herriges (1984).

Third wave

The 2000–01 California energy crisis gave impetus to the next wave of pilots with TVR. In addition to TOU rates, they featured dynamic pricing designs.[22] Unlike TOU, where the time periods and the prices for each period are known in advance, dynamic prices may or may not be known in advance and the time period over which the prices are invoked may or may not be fixed in advance. In the third wave, dynamic pricing pilots included studies of TOU pricing as well as other types of dynamic pricing. Some of these pilots featured enabling technologies such as in-home displays and smart thermostats.

In California, a statewide pricing pilot involving all three investor-owned utilities was conducted in 2003–04. It showed that customers reduced peak-period energy use in response to time-varying prices.[23] This pilot was a game changer. Since 2013, many more pilots have been conducted around the globe, bringing the total worldwide experience to almost 80 pilots featuring over 400 energy-only pricing treatments.[24] Figure 1 summarizes peak reduction effects from these pilots conducted through 2021, with each data point representing a single pricing treatment.

The figure shows that as customers' peak-to-off-peak price ratio increases, customers reduce their peak consumption more, although at a declining rate. The solid curve in Figure 2 show effects in response to prices only and without enabling technologies. Enabling technologies, such as smart thermostats, were shown to enhance customer responsiveness, as demonstrated by the dotted curve.[25] These results reinforce previous findings that customers do respond to price signals and that enabling technologies significantly enhance that responsiveness.

FIGURE 2 THE ARC OF PRICE RESPONSIVENESS BY TECHNOLOGY

[24] Ahmad Faruqui, Sanem Sergici and Cody Warner (2017); Ahmad Faruqui, Sanem Sergici and Ziyi Tang, "Do Customers Respond to TVR: A Preview of Arcturus 3.0" (2023).
[25] The difference between the curves is statistically significant and each of the curves by itself is also statistically significant.

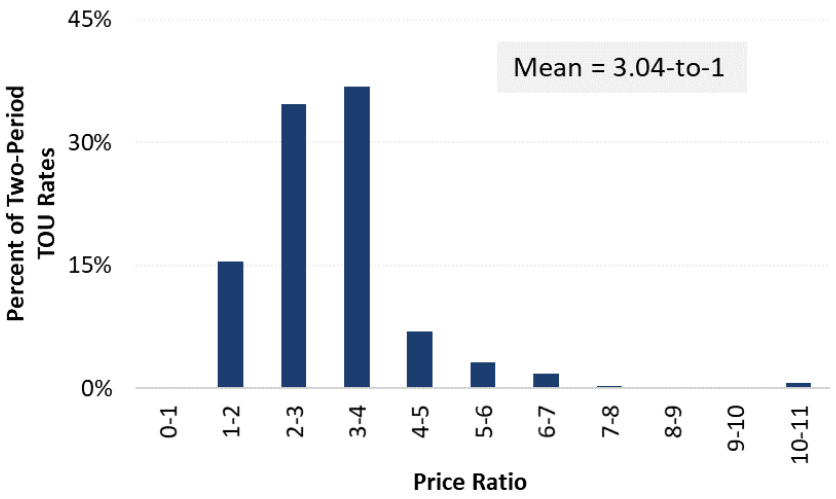
In the third wave of pilots, observers also discovered that low income customers can be price-responsive, although not to the same degree as the average residential customer. A 2012 study summarized the insights gained from these pilots.[26]

Overall, the third wave of pilots yielded rich information on customer responsiveness to time-varying pricing. Pilots in the third wave provided the impetus and scientific evidence for widespread investment in advanced metering infrastructure.

Fourth wave

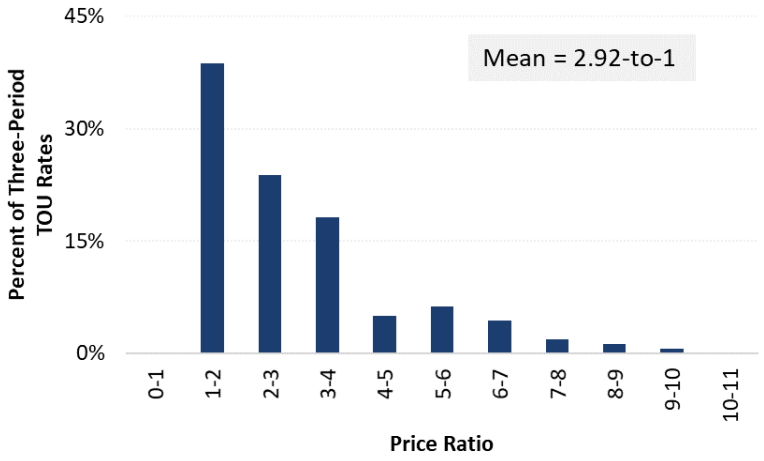
The fourth wave involved the large-scale rollout of TVR. Some featured two pricing periods and others featured three pricing periods. Today, the ratio of peak to off-peak prices in 85% of the two-period TOU rates is at least 2:1 while the mean price ratio is 3:1. TOU rates with three periods have a similar price ratio as those with two periods.[27]

FIGURE 3 PRICE RATIO IN TWO-PERIOD TIME-OF-USE RATES



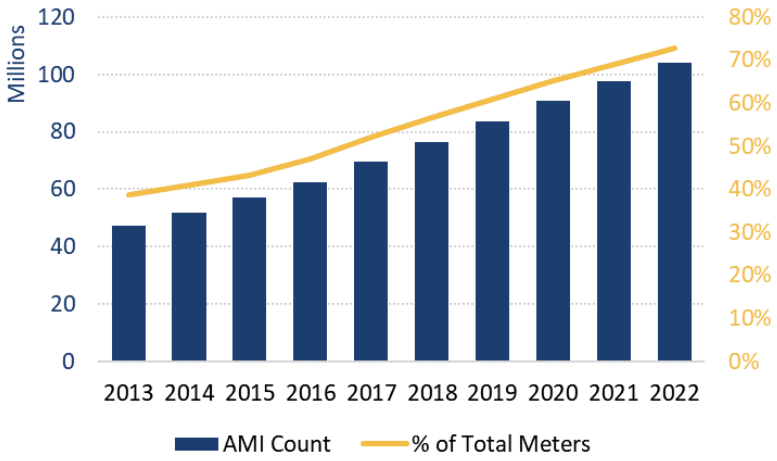
[26] Ahmad Faruqui, Ryan Hledik, and Jennifer Palmer (2012).
[27] US Department of Energy, Utility Rate Database, OpenEI, last modified February 2023, accessed at https://openei.org/wiki/Utility_Rate_Database.

FIGURE 4 PRICE RATIO IN THREE-PERIOD TIME-OF-USE RATES



In the fourth wave, the implementation of TVR did not keep pace with the installation of advanced metering infrastructure. According to EIA-861 Survey, 104.2 million households have advanced metering infrastructure, which is about 73% of total residential electric meters in 2022.[28]

FIGURE 5 SMART METER INSTALLATION (2013-2022)



But only 13.1 million households are enrolled on a TVR, which is about 9.4% of total number of residential customers. The barriers to large-scale implementation of TVR include:

- Insufficient evidence of benefits: Stakeholders are still not convinced benefits would be realized through full-scale deployment. Unless evidence of benefits is compelling, regulators, utilities, and customers will fear that a broader group of customers will be harmed by the new rates and that they will fail to promote economic efficiency or equity.
- Customer dissatisfaction and backlash: The move from flat rates to TVR will more efficiently and fairly allocate costs among individual customers but it will definitely raise bills for customers whose load factors

[28] "Annual Electric Power Industry Report", Form EIA-861, U.S. Energy Information Administration, Oct 5, 2023, accessed at https://www.eia.gov/electricity/data/eia861/.

are lower than the average load factor for the residential class. It may take time for those customers experiencing bill increases to understand how to manage their electricity consumption relative to the new rate structure. Additional investment in customer education and outreach will be needed to help customers fully understand the new rates, how to choose among their rate options, and how to adjust their usage patterns to lower their bills. It would be useful to give customers a choice of several rates, including flat rates, TOU rates with different price differentials across periods, and dynamic pricing rates.

- Effects on sensitive or disadvantaged customers: Special attention has to be paid to the needs of customers with medical disabilities, customers who are unemployed and low income customers in general.

Some questions remain about how customers will react with full-scale deployment, even though study after study has shown that such rates will yield real and quantifiable efficiency benefits to customers. Despite this evidence, there are persistent fears about a customer backlash or a failure to realize expected benefits. There are ways to overcome these fears, including:

- Customer bill effect studies: Utilities and regulators can conduct studies to understand how customer bills will be affected.
- Customer behavior studies: There are models available today for carrying out simulations to determine the likely customer response. These models draw from findings in prior pilot studies.
- Customer outreach and education: Utilities can engage in customer outreach programs to explain why tariffs are being changed and how the new tariffs will work. It will be important to ensure the new rates use clear and understandable language. Utilities can enlist neutral parties to endorse the change and they can use modern social media to spread the word.

Tapping into the newer generations of technology-savvy customers will be crucial. Utilities can develop new and more efficient ways to communicate with their customers, help to develop apps and smart energy tools, and otherwise explore methods to enhance the customer experience with technology. Here are some options for easing the transition:

- Transition rates: Utilities and regulators can design transition schemes that change the rates gradually over three to five years.
- Bill protection: Alternatively, bill protections can be provided to customers, ensuring that customer bills will not go up but they will be able to keep the savings, with those protections being phased out gradually over time.
- Add protections for sensitive customers: For the first five years, rates could be optional for sensitive or disadvantaged customers, such as low-income customers, small users, and disabled customers. Or these customers could be provided financial assistance for a limited period of time.
- Provide additional information and options to customers: There may be ways to provide additional options for customer participation. For example, consider a subscription concept in which customers “buy” their historical usage at the historical price, and buy or sell deviations from that usage at the new tariffs. This option would also help to transition into the fifth wave of tariff reform involving transactive energy.

Fifth Wave

We have now entered the fifth wave. Enabling residential customer responsiveness under TVR should be a priority. Once cost-reflective tariffs are in place, technological barriers will have to be overcome to achieve customer engagement. Better tools will have to be provided to customers to help them lower their bills.

New technology is already beginning to reveal to customers the extent to which electricity cost can vary depending on usage patterns over time. Public policies and initiatives are opening the door for households to have more control over the source of their electricity—beyond retail choice—through distributed generation. Smart appliances, thermostats, and apps are giving residential customers more tools to control and customize usage patterns. Customers will still have the right to access reliable power supply, but these changes will continue to give households more power to optimize their individual electricity use, their cost of electricity, and their environmental footprint.

We also expect continued improvements in data exchanges from and to smart houses to give residential customers opportunities to capture value directly from wholesale electricity markets. This means that customers will not only react to wholesale market and system conditions, but they will actively participate in wholesale markets through agents or technologies that allow customers to communicate and coordinate directly with market administrators and system operators. Not all customers will have the appetite for engaging in power supply decisions to this degree, but the newer generations of customers who are used to social media, fast-paced and complex communications, and a suite of apps to manage their lives will not find this foreign. Some customers will install solar panels, battery storage, and load flexible HVAC systems and appliances to lower their bills and take advantage of TVR.

In one vision of how this could evolve, customers would subscribe to a "baseline" load shape based on their typical usage patterns. They could buy or sell deviations from the baseline on the wholesale market through sophisticated energy management systems or agents. This was originally called "demand subscription," but the idea has morphed into "transactive energy".[29] This vision has gained some traction with millennials through Wi-Fi thermostats, digital appliances, and first-generation home energy management systems. Regardless of the specific method, we believe that in the future the gaps among customers, retail markets, and wholesale markets will be significantly reduced.

But this future cannot be realized if customers do not have even the basic information on how their usage patterns relate to the real cost structure of electricity. Customers cannot react to the high production and investment costs of electricity during peak demand periods if they are shielded from observing these costs at the point of consumption. Customers who are charged the traditional and mostly flat volumetric rate for electricity will be immobilized in the transactive energy future. They will not have the incentives or information necessary to lower their bills in an efficient manner, participate in valuable demand-side services in wholesale markets, or actively contribute to more efficient electricity production and investments in the future.

Household electricity historically has been mostly a uniform commodity for consumers, indistinguishable by source or time of use. For the most part, utilities could price electricity as if it were a uniform commodity without harming their bottom line. But in recent years a number of industry shocks and changes have made it clear that this pricing scheme is not always best for customers or utilities. The first four waves of tariff reform have gauged consumer response and enabled utilities to price electricity more efficiently as the diverse product it is. At the same time,

[29] Stephen Barrager and Edward Cazalet (2014).

customers are awakening to the diversity of electricity supply depending on location, time of day, and environmental attributes.

Driven by the need to reduce carbon emissions and to promote load flexibility, the California Public Utilities Commission (CPUC) is evaluating a rate design concept called CalFUSE in to enable widespread adoption of demand flexibility solutions.[30] The opt-in CalFUSE frameworks include a broad spectrum of six elements to: develop standardized, universal access to current electricity price, introduce dynamic prices based on real-time, wholesale energy cost, incorporate dynamic capacity charges based on real-time grid utilization, transition to bidirectional prices, offer subscription option, and introduce transactive features. The tariff separates the collection of energy and distribution costs and introduces the notion of scarcity pricing to allocate capacity charges to time periods.

Section 2: Lessons Learned from Deploying TVR

Several lessons can be gleaned from the past four decades which would help in designing better rates in the future.

1. Don't oversell the benefits of TVR

In the early 2000s, Puget Sound Energy in the Pacific Northwest rolled out what its CEO termed a "dynamic pricing" rate. But the new rate was simply a TOU rate with three pricing period. Notably, the price differential between the peak and off-peak periods was only 30%. Customers were informed they would save money on the rate. Some customers shifted nearly half their loads from peak to off-peak periods only to discover a year later that they had only saved 50 cents to a dollar per month. Customers felt cheated. Ten percent dropped out. Local and national media outlets reported on the story. The backlash was severe. The utility ended the program, giving TOU rates a bad rap.

Lesson: Don't oversell the savings from TVR.

2. Pilots are not Always Needed

After witnessing the California energy crisis, the Ontario Energy Board decided to move all customers in the province to TOU rates once smart meters had been deployed. No pilot preceded the TOU deployment. The TOU program succeeded because the Premier was a visionary.

Lesson: A pilot is not always necessary.

3. Embrace Gradualism

[30] California Public Utilities Commission (2022).

One of the most successful TOU programs in the U.S. was launched by SMUD in California. It conducted pilots with CPP and TOU rates. Results were positive and the utility decided to introduce them to its customers. The success of the roll-out campaign can be attributed to a smooth transition plan which spanned three years.

Another example is provided by the Australia Energy Market Commission. To accelerate the deployment of TOU rates, it suggested that they be made mandatory for the largest customers, opt-in for vulnerable customers and be the default for everyone else. However, advocates of the vulnerable customer group thought the design was "a trap" and vehemently opposed it. In the end, the plan did not win the government's approval and was scuttled.

Lesson: Coordinate the design and rollout of TVRs with all stakeholder.

4. Think Outside the (Service Territory) Box

Until 1990, RTP was an academic concept in the US[31] until Georgia Power introduced it to its large commercial and industrial customers. The utility hired a pricing manager from ESKOM in South Africa who had implemented a successful RTP program for large mining customers. Because mining uses electricity heavily and because mining operations can be disrupted, RTP was the perfect rate option for this sector. The pricing manager brought the practice with him to the U.S.

The RTP rate had a two-stage structure. In the first stage, customers paid what they had paid historically by holding their load profile constant. In the second stage, they paid for changes in the load profile on an hourly basis. The first stage bill included a fixed charge, a demand charge and a flat energy charge. In the second stage, the hourly prices were based on marginal energy costs. Customers were notified of the prices on an hour-ahead basis.

The utility recruited customers from inside and outside of the U.S. to relocate to the utility's service territory and participate in the RTP program. The program was designed for customers with maximum demands higher than 1 MW. Load dropped 17 percent on average whenever wholesale price exceeded $1/kWh. Initially offered to industrial customers, the program was later extended to commercial customers. Years later, a day-ahead version was made available to C&I customers with less than 1 MW demand.

Lesson learned: Persistence and perseverance pay off.

5. Key Decision Makers Need to be On Board

TVA, a federal agency, serves power to more than 150 publicly owned utilities in the southeastern US and also designs their rates. TVA wished to modernize its rate designs. However, smart metering was not available. To brainstorm solutions, the agency organized a workshop with its distribution utilities. After considering all the options, seasonal rates were proposed and everyone was on board with them. However, TVA's board rejected the idea. The board members were concerned that customers with central air conditioning systems would see higher bills.

Lesson: Anticipate adverse reaction from those who are going to see higher bills.

[31] It had been discussed elsewhere. See, e.g., Littlechild (2003).

6. Mind the Transition Costs

In Oklahoma, OGE's CEO asked his leadership team to explore demand-side solutions instead of building a 600-MW power plant. After doing comprehensive market research, the utility reached the conclusion that there was enough appetite for the utility to pilot a sophisticated variable-peak pricing (VPP) rate with four levels of critical-peak pricing. It also installed smart thermostats on customer premises. Instead of the utility controlling the thermostat, customers had their own control and could pre-set it to their comfort level in advance.

The pilot was successful and the utility offered VPP to all its customers on an opt-in basis. In five years, the participation rate reached nearly 15 percent. On average, the program reduced the peak demand of participating customers by 40 percent, lowering customer bills by 20 percent. The program's success was attributed to word-of-mouth marketing. The VPP prices were sent directly to the thermostat, where the customer had programmed the temperature settings by price.

Lesson: Customer centricity is vital to the success of innovative rates.

7. When There's a Will, there's a Way.

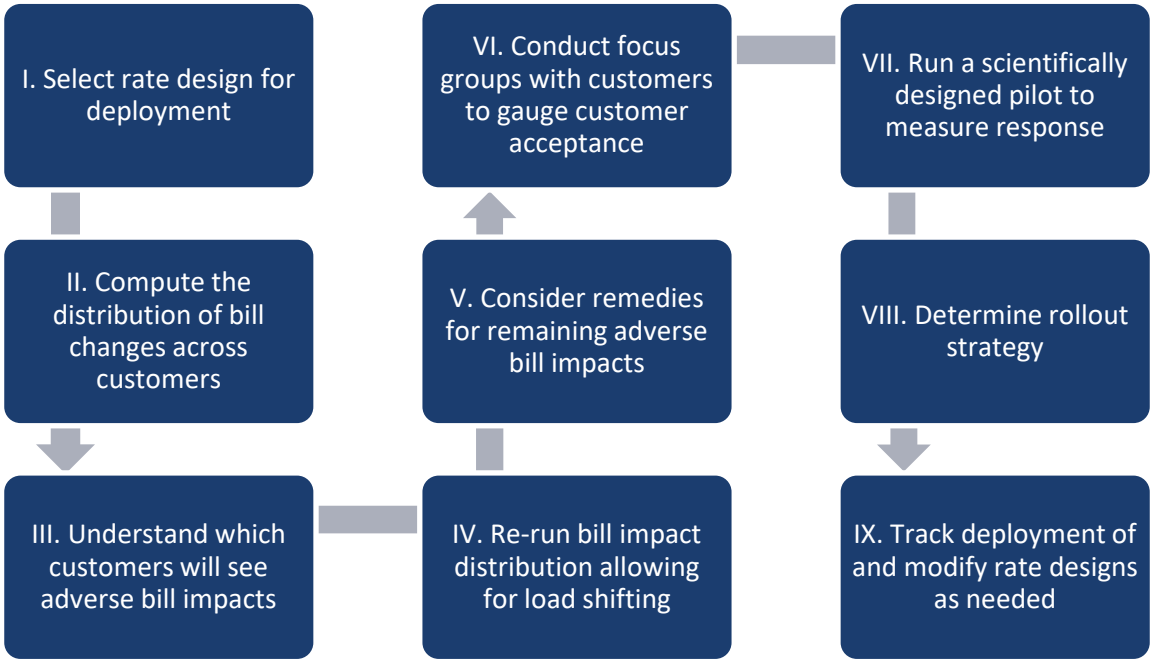
In the course of exploring rate design reforms in the late 2000s, BGE in Maryland became interested in applying the lessons learned from California's pricing pilots involving TOU rates and CPP rates which involved all three investor-owned utilities and ran for two years. The utility decided to launch a CPP pilot of its own and also pair it with a peak-time rebate (PTR) pilot. The pilot ran for four years. The results showed that the peak reduction from CPP and PTR were about the same. The utility decided to proceed with PTR since it believed that there were no losers under this design. PTR was offered to all customers as a default option. Analysis showed that some 88% of customers participated in it and peak demand during critical hours dropped by 15-20%.

Lesson: A PTR may be more palatable than a CPP rate.

Section 3: Strategies for Rate Modernization

Each utility follows its own pathway, depending on its particular circumstances. In general, most utilities follow this pathway.

FIGURE 6 A NINE-STEP PATHWAY FOR TRANSITIONING TO MODERN RATE DESIGN



I. Select Rate Design for Deployment

Select the specific rate design for deployment. In some case, more than one rate design may be picked for deployment. Utilities should evaluate each of these options and offer choices to customers along an efficient pricing frontier. Some of the choices being considered or offered by utilities to their customers are listed in the Table 1.[32] When these rate design options are offered to customers, they will be able to pick the one that represents the best combination of risk and reward.

FIGURE 7 THE EFFICIENT PRICING FRONTIER

[32] Ahmad Faruqui and Cecile Bourbonnais (2020).

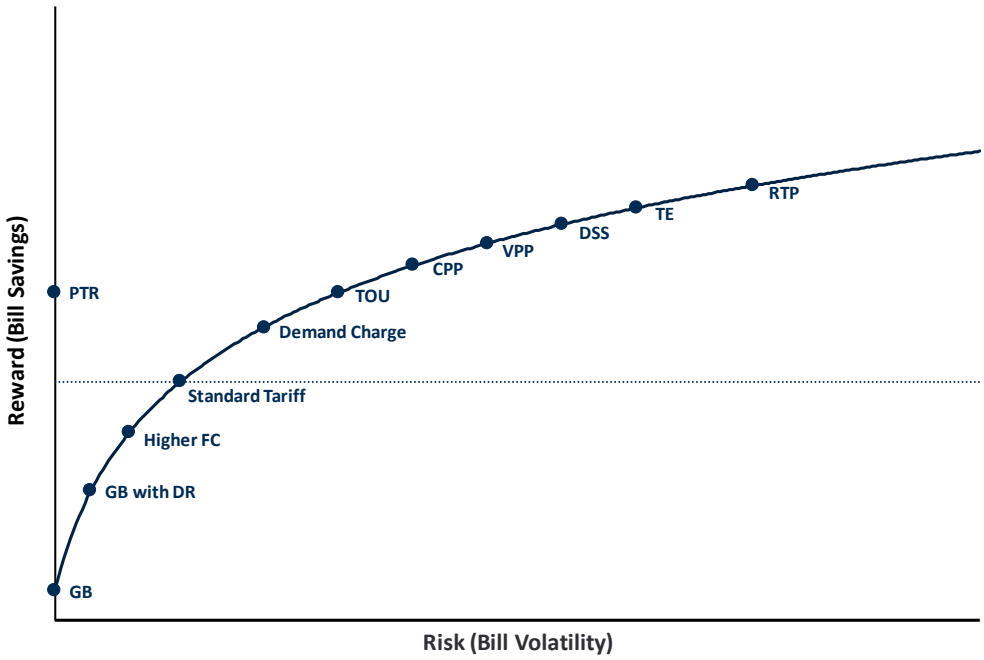


TABLE 1 RATE DESIGN OPTIONS

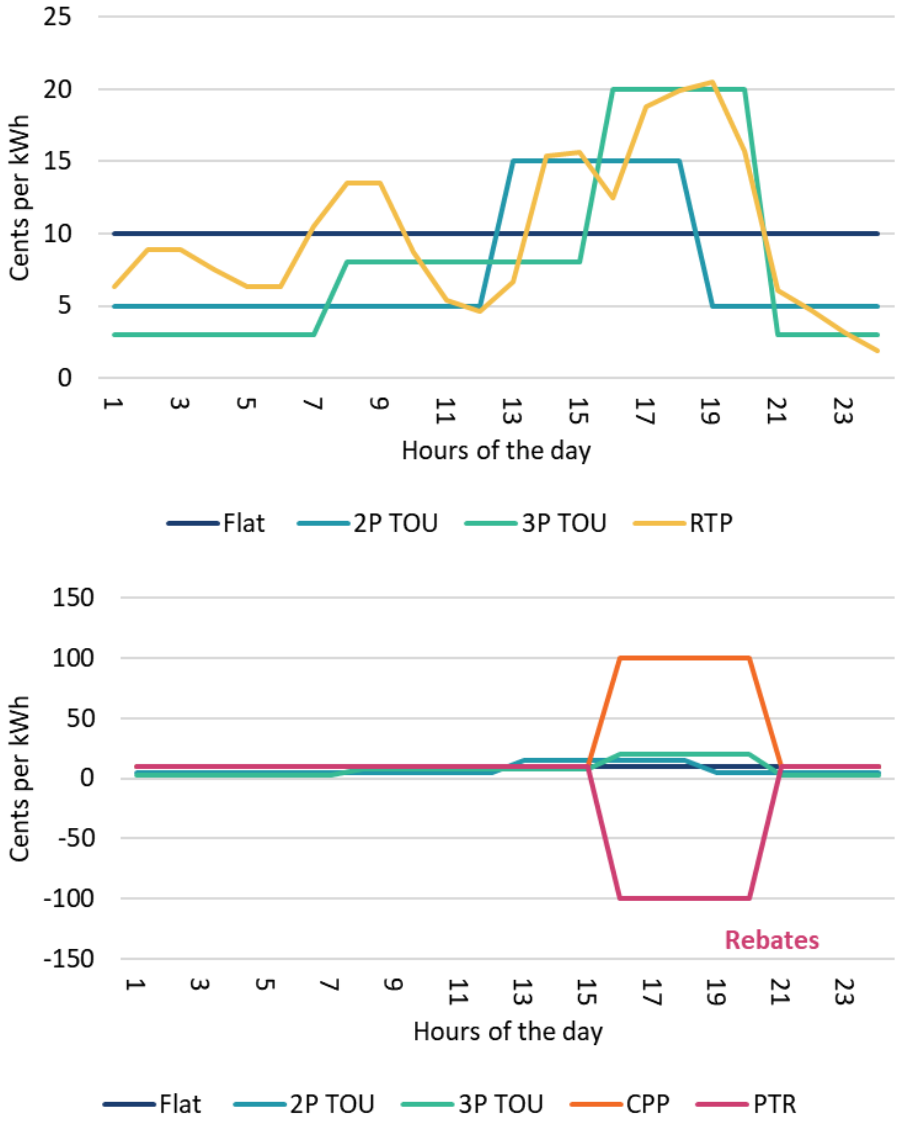
Rate Design	Definition
Guaranteed Bill (GB)	Customers pay the same bill every month, regardless of usage.
Flat Rate	A uniform $/kWh rate is applied to all usage.
Demand Charge	Customers are charged based on peak electricity consumption, typically over a span of 15, 30, or 60 minutes.
Time-of-Use (TOU)	The day is divided into time periods which define peak and off-peak hours. Prices are higher during the peak period hours to reflect the higher cost of supplying energy during that period.
Critical Peak Pricing (CPP)	Customers pay higher prices during critical events when system costs are highest or when the power grid is severely stressed.
Inclining Block Rates (IBR)	Customers are charged a higher rate for each incremental block of consumption.
Peak Time Rebates (PTR)	Customers are paid for load reductions on critical days, estimated relative to a forecast of what the customer would have otherwise consumed (their "baseline").
Variable Peak Pricing (VPP)	During pre-defined peak periods, customers pay a rate that varies by utility to reflect the actual cost of electricity.
Demand Subscription Service (DSS)	Customers subscribe to a kW demand level based on the size of their connected load. If they exceed their subscribed level, they must reduce their demand to restore electrical service.
Transactive Energy (TE)	Customers subscribe to a "baseline" load shape based on their typical usage patterns, and then buy or sell deviations from their baseline.
Real-Time Pricing (RTP)	Customers pay prices that vary by the hour to reflect the actual cost of electricity.

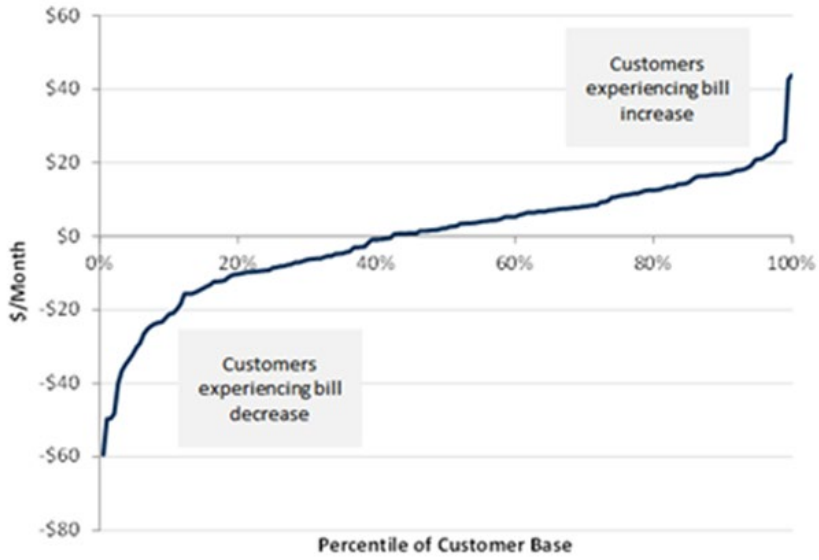
FIGURE 8 STYLIZED TIME-VARYING RATES



II. Estimate the distribution of bill changes across customers

For the chosen rate design(s), compute the impact of the rate design on a representative sample of customers. Plot the results in the form of a "propeller" chart, such as Figure 8, identifying those who are going to see higher bills and those who will see lower bills under the assumption that customers will not change their load shape.

FIGURE 9 DISTRIBUTION OF BILL IMPACTS



III. Understand which customers will see adverse bill impacts

Try to understand the sociodemographic and regional characteristics of those customers who are going to experience significantly higher bills. Identify policies that can be used to mitigate the adverse impacts. Examples include the offering the rebates to low-income customers and carrying out energy efficiency improvements in their facilities. If the rates would be offered to them on an opt-in basis, they could be given bill protection for the first year or two as they try them out. If the rates would be offered to them on an opt-out basis, such customers could be excluded from the default provisions altogether.

IV. Re-run bill impact distribution allowing for load shifting

Re-run the bill impact analysis by allowing for changes in load shapes that would occur as customers respond to the price signals. For example, lower off-peak rates would encourage them to raise off-peak usage and higher on-peak rates would encourage them to lower peak usage. Databases and models exist to simulate changes in customer load shapes. Changes in load shapes will mitigate the adverse bill impacts.

V. Consider remedies for remaining adverse bill impacts

If the adverse bill impacts are still significant for certain groups of customers, consider instituting one of these remedies shown in Table 2.

TABLE 2 REMEDIES FOR ADVERSE BILL IMPACT

Remedy	Implementation
Gradualism	Roll out the new rates gradually for each rate design element. For example, to introduce a TOU rate, if the peak price will be 25 ¢/kWh and the current tariff is 15 ¢/kWh, implement a peak price of 17 ¢/kWh in the first year and increase it annually by 2 ¢/kWh until it reaches 25 ¢/kWh.
Bill Protection	Provide customers with bill protection for a limited period so that they pay the lower of their old and new bill.
Optional Rates	Make the new rate design optional for vulnerable customers, mandatory for the largest customers, and the default for all other customers.

Financial Assistance	Provide customers with adverse bill impacts financial assistance for a limited period.
Enabling Technologies	Install enabling technologies such as smart thermostats on customer premises.
Two-staged Rollout	Structure the rate into two stages, where the first stage charges customers the current rate if their usage resembles a historical reference period, and the second stage exposes them to the new rate.

VI. Conduct focus groups with customers to gauge customer acceptance

These will help determine how best to communicate the rationale behind the selected rates and to see if they would be comfortable with the modern rate designs. Make appropriate modifications in language to make the modern rate designs understandable to customers.

VII. Run a scientifically-designed pilot to measure response

The pilot should be designed on scientific principles that would preserve the internal and external validity of the results, allowing them to be extrapolated to the population of customers. There are three ways of ensuring that pilots will yield results that are statistically valid and generalizable to the population at large. These include randomized control trials, randomized encouragement designs, and matching controls. Analysis of before-and-after data on the "treatment" customers who are on modern rates, and side-by-side data on treatment group and control group customers can then be carried out using econometric methods to yield a difference-in-differences estimate of the impact of the new rates on customer load shapes. Price elasticities can also be derived, allowing results to be predicted for a wide range of rates, not just those that are included in the pilot.

VIII. Determine rollout strategy

Decide on the rollout strategy. It could be opt-in, opt-out or mandatory. Examples of each are presented below.

- In Arizona, a variety of TOU rates are offered on an opt-in basis by two utilities, Arizona Public Service (APS) and the Salt River Project (SRP). About 61 percent of APS' customers and 35 percent of SRP's residential customers take service on a TOU rate. Analyses from a sample of customer numbers show that TOU rates with a shorter peak period yields an average reduction of 17% of on-peak kWh and TOU rates with a longer peak period have an average of 8% reduction.
- In Colorado, Fort Collins, a small utility, moved all its customers from volumetric rates to TOU rates in October 2018. The deployment was mandatory and it was preceded by a one-year pilot. The residential opt-out pilot showed a 2.5% reduction in energy consumption. Xcel Energy, a much bigger utility, began rolling out a default TOU rate in 2022 to all customers with smart meters. It was preceded by a pilot.
- In Michigan, Consumers Energy rolled out TOU rates as the default tariff to all its residential customers in 2021. The deployment was preceded by a pilot program that saw a general reduction in peak energy of between 3% and 4%. DTE Energy has recently rolled out TOU rates as the default tariff. Customers can opt-out to other rates but all of them are TOU rates. Both utilities offer choices but they are all TOU rates.
- In Illinois, Commonwealth Edison and Ameren offer RTP to their customers but only 2% have taken it.
- Georgia Power is rolling a few TOU rates to its residential customers, including a rate with a significantly lower off-peak rate designed specifically for EV owners.

- In Missouri, regulators have ordered Ameren and Evergy to roll out default TOU rates in October with peak to off-peak price ratio that range from 4:1 to 5:1. These are the highest such ratios in default TOU rates in the US.[33]

IX. Modify rate designs as needed

Finally, track the deployment of the modern rate design(s) and survey the customers for feedback. The utility can set up social media sites and monitor the conversation, and make necessary modifications in the rate design on a regular basis.

Section 4: What's Likely to Happen in the Future?

As utilities begin the transition to net zero, they will incentivize customers to install new technologies that promote electrification through rebates and low interest financing programs. Additional incentives will come from governments at the federal, state and local levels.

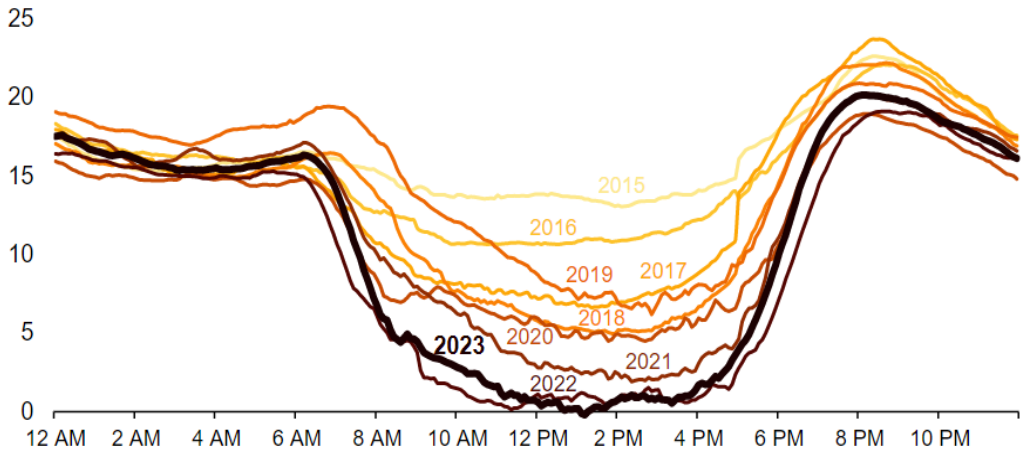
The most prominent technologies that are receiving incentives today are electric vehicles (EVs) and heat pumps. Also, faced with rising bills, and seeking to move toward an organic lifestyle, customers are moving forward by installing photovoltaic (PV) panels on their roofs. An increasing number of new PV installations are integrated with battery energy storage systems. They are receiving significant incentives from the federal government. Many of these customers also drive EVs.

As EVs and heat pumps are widely deployed, utilities will need to find a way for managing the growth in peak loads that will follow their deployment. As the share of large scale solar grows on the supply side, utilities will see that their net peak load will shift from the early afternoon hours to the late afternoon an early evening hours. This phenomenon, knowns as the duck curve (Figure 9), has already begun to happen in California.[34] The peak period used to run from noon to 6 pm about two decades ago. A decade ago, it shifted to the 2 pm to 7 pm window. Now it runs from 4 pm to 9 pm.

[33] Jeffrey Tomich, "Missouri overhauls electric rates, raising rewards – and risks – for customers", *EnergyWire*, July 12,2023, https://www.eenews.net/articles/missouri-overhauls-electric-rates-raising-rewards-and-risks-for-customers/.

[34] "As solar capacity grows, duck curves are getting deeper in California", U.S. Energy Information Administration, June 21, 2023, accessed at https://www.eia.gov/todayinenergy/detail.php?id=56880.

FIGURE 10 CALIFORNIA'S DUCK CURVE (CAISO LOWEST NET LOAD DAY EACH SPRING, 2015-2023, GW)



In Hawaii, the off-peak period now lies in the afternoon hours and the same is evident in Australia, where a "sponge tariff" is offered to encourage additional energy use in the afternoon hours.

In all of these cases, a TOU tariff will prove to be an indispensable resource to encourage off-peak charging. That's already the case in California where the off-peak period now begins at midnight, to encourage the nighttime charging of EVs.

More and more utilities are beginning to offer TOU rates with exceptionally low off-peak rates. These are often three-period rates where the off-peak period begins at midnight.

As for dynamic pricing, despite the substantial benefits that economists have pointed out,[35] the future remains uncertain:

- In Illinois, hourly real-time pricing is offered to the state's 4.7 million electric customers by its two investor-owned utilities. Under 2% of customers have taken it.
- In California, residential customers have been offered CPP for more than a decade. Only 2% of customers have taken it.[36]
- In Oklahoma, OG&E has had more success with a more advanced version of CPP known as variable-peak pricing (VPP). The price on critical days can rise to four different levels, depending on the severity of the demand-supply imbalance. Because of customer-friendly rate design and exceptionally good marketing, that pricing program has achieved an adoption rate of 14.7%. But it remains the exception to the rule.

New forms of pricing continue to evolve. The latest version is called Subscription Pricing. In that design, customers are offered a fixed bill based on their historical pattern of use. It's somewhat higher than their average monthly bill. It offers peace of mind to the customer and is akin to the type of pricing used by Internet providers and companies such as Netflix. A more advanced version of Subscription Pricing offers customers a chance to lower

[35] See, for example, Severin Borenstein (2005), Ahmad Faruqui (2010), William Hogan (2010), and Schittekatte et al. (2023, forthcoming).

[36] For experimental results from a small municipal utility in southern California, see Frank A. Wolak (2007).

their fixed bills by reducing their usage during critical hours when the demand-supply equation appears to be going out of balance. It's called Subscription+.[37]

Utilities are beginning to realize that the best way to enhance customer satisfaction is to give them choices of rates. Some want bill stability and are willing to pay a bit more for that. That's where subscription pricing comes in. Others want flat rates. Still others are willing to move some of their consumption out of the peak period to off-peak periods and are happy to go on a TVR. Most of the last group of customers are interested in a two or three period TOU rate but some are willing to try variants of dynamic pricing. They come with added risk but also can yield the lowest bills.

Section 5: Conclusions

The evolution of TVR in the US has been very slow over the past four decades for a number of reasons. Among them, lack of metering, consumer reluctance to try something new, and a fear that these rates will raise bills. Long peak pricing periods that spanned most of the day time hours were a major barrier to customer adoption.

Consumers don't put much stock in notions such as allocative efficiency that have the status of an axiomatic truth among economists. They don't care much about rates being cost based, consistent with the principles put forward by Bonbright.

Utilities have been reluctant to offer them on an optional basis, concerned that only those who would lower their bills would sign up for time-varying tariffs, eroding revenues. They have also been skeptical that TVR would induce load shifting from peak to off-peak periods, and lower costs for all customers by reducing the need for new capacity additions.

For decades, TVR were an exotic service offering, requiring the installation of a special interval meter. Today, smart meters are deployed in nearly 70% of American households. So are programmable thermostats, many come with WIFI capability, but even today few customers bother to program them. Many appliances such as dishwashers have timers built into them but that feature is rarely used. Customer apathy is still very much a part of life.

But what has really begun to move the needle is the arrival of electric vehicles (EVs). Consumers have begun asking for TVR because they can reduce their cost of charging by more than half. Utilities are more than happy to offer TVR to EV owners since they encourage off-peak charging and avoid the need to invest in expensive peaking capacity.

An additional reason why utilities are interested in moving customers to TVR is the installation of rooftop solar panels (PVs) by customers.

The new generation of TVR are designed with customer lifestyles and convenience in mind. Peak periods are shorter than they used to be, and prices are dropped substantially in a third pricing period, which usually occurs during the night, to encourage the charging of EVs. Lessons have been learned.

As a result, TVR are being offered by more utilities, often accompanied by bill calculators on web portals to help customers pick their best rate. As a sign of the times, a few states have decided to make TVR the default option for their customers and one has made them mandatory.

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
KAREN REIF
VICE PRESIDENT OF RENEWABLES AND ENERGY SOLUTIONS

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Karen Reif. My business address is 80 Park Plaza, Newark, New Jersey, 07102.

Q. In what capacity are you employed?

A. I am currently employed by Public Service Electric and Gas Company ("PSE&G" or "Company") as Vice President of Renewables and Energy Solutions. I have been employed by PSE&G for 28 years in a number of positions in trading, deregulated subsidiaries, information technology, and continuous improvement. I have held my present position since 2018. My credentials are set forth in Schedule KR-1.

Q. What is the purpose of your testimony?

A. As part of PSE&G's 2023 base rate filing with the New Jersey Board of Public Utilities ("BPU" or "Board"), the purpose of my testimony is to provide information regarding the PSE&G Clean Energy Future – Electric Vehicles ("CEF-EV") program that will support a finding by the Board that the investments and expenditures made by the program are prudent and reasonable. The Company should be permitted to establish rates in this proceeding that will permit recovery of both the CEF-EV costs that the Company proposes to include in to rates and the regulatory asset balances of CEF-EV capital and operation and maintenance ("O&M") costs that have been established in accordance with the Board's January 27, 2021 Order in BPU Docket No.

EO18101111.[1] My testimony will describe the programs and their implementation as well as costs and investments to date and expected during the test period. The details of the Company's accounting and cost recovery are presented in the testimony of witness Michael McFadden. The template for rate adjustments after this rate case proceeding as allowed in the CEF-EV Order are presented in the testimony of witness Mr. Stephen Swetz.

Q. Do you sponsor any schedules as part of your direct testimony?

A. Yes. I sponsor the following schedules that were prepared or compiled under my direction and supervision.

(1) Schedule KR-1 sets forth my credentials;

(3) Schedule KR-2 includes the Company's CEF-EV semi-annual reports as required by the CEF-EV Order.

II. THE COMPANY'S CEF-EV PROGRAMS

Q. Please describe the Company's CEF-EV Program that was approved by the Board in its CEF-EV Order.

A. In 2018, in light of legislative and executive actions in New Jersey supporting electric vehicles, PSE&G filed its CEF-EV program in conjunction with a proposal for energy storage. [2] Subsequently, while PSE&G's program was pending approval, the legislature passed the Plug In Vehicle Act of 2020 directing the Board to adopt policies and programs to advance the adoption

[1] *I/M/O The Petition Of Public Service Electric and Gas Company For Approval Of Its Clean Energy Future – Electric Vehicle And Energy Storage ("CEF-EVES") Program On A Regulated Basis*, BPU Docket No. EO18101111, "Decision and Order Approving Stipulation" (January 27, 2021) ("CEF-EV Order"). The cost recovery mechanism established in that Board Order is discussed in the testimony of Michael McFadden.

[2] New Jersey's 2018 Clean Energy Law (P.L. 2018, c. 17, § 1(a)(2), directed the Board to conduct an analysis of whether implementation of energy storage systems would promote the use of electric vehicles, and Executive Order 28 called for the development of a revised Energy Master Plan to include exploration of methods to incentivize transportation electrification. Additionally at that time New Jersey had recently become a partner in California's zero-emission vehicle program that stipulated that large volume automobile manufacturers achieve a certain percentage of sales from EVs.

of EVs, and the Board issued an order implementing the Act establishing requirements for utility files for light-duty EV charging infrastructure.[3]

In 2021, the CEF-EV Order authorized PSE&G to invest up to $166.2 million in facilities associated with its CEF-EV programs and to incur up to $39 million of incremental O&M expenses, including administrative costs, to support the program. The CEF-EV programs consist of the following three subprograms: (i) a Residential Smart Charging program; (ii) a Level 2 Mixed Use Commercial Charging program; and (iii) a Public Direct Current ("DC") Fast Charging program.[4] The CEF-EV program also provides for cross-program investments for Information Technology ("IT") system upgrades and modifications that support administration of the program.

Q. Please describe the Residential Smart Charging subprogram.

A. The Residential Smart Charging program permits the Company to provide utility incentives to individual residential sites to offset up to $1,500 of the costs of electric facilities required between the utility electric meter and the EV charging stub. The program budget of $60 million is designed to provide make-ready costs for up to 40,000 charging stubs. The Make-Ready work from the meter to the charging station includes the pre-wiring of electrical infrastructure at a parking space or a set of parking spaces to facilitate easy and cost-efficient installation of EV Service Equipment. This program also permits the Company to provide utility incentives of up to $5,000 to offset the costs of making a site Charger-Ready from the utility pole to the meter. This pole-to-meter work includes activities and facilities needed to upgrade an electric service to

[3] PIV Act, P.L. 2019, c.362, codified at N.J.S.A. 48:25-1, *et seq*; *In the Matter of Straw Proposal on Electric Vehicle Infrastructure Build Out*, B.P.U. Docket No. QO20050357 (Order Adopting the Minimum Filing Requirements for Light-Duty, Publicly-Accessible Electric Vehicle Charging, September 23, 2020.

[4] The CEF-EV order holds PSE&G's energy storage proposal and a medium-heavy duty EV program in abeyance pending the Board's consideration of energy storage policy issues and policy for medium-heavy-duty EV charging infrastructure.

accommodate EV service equipment. The budget for this portion of the subprogram is $20 million and is designed to enable the Company to provide incentives at up to 4,000 locations.

Q. Please describe the Mixed Use Commercial Level 2 subprogram.

A. This subprogram is designed to incentivize the installation of 3,500 chargers at 875 sites that include multi-family unit developments, government facilities and public facilities. Under the program PSE&G will provide (i) utility incentives up to $7,500 per charger to cover the make-ready costs of serving up to 3,500 charger stubs up to a total investment of $26.25 million, and (ii) utility incentives to offset up to $10,000 of make-ready electric service upgrades for up to 875 locations, up to a total investment of $8.75 million.

Q. Please describe the Public DC Fast-Charging subprogram.

A. Under this subprogram, PSE&G will provide (i) utility incentives of up to $25,000 per charger of make-ready utility meter to charger stub costs for up to 1,200 fast charger stations, up to a total investment of $30 million, and (ii) utility incentives to offset up to $50,000 of make-ready electric service upgrade costs for up to 300 locations, up to a total investment of $15 million. Of the total $30 million of investments for make-ready utility meter to charger stub work, $5 million is being used to provide demand charge rebates to customers under Rate Schedules GLP and LPL.

Q. Did the CEF-EV Order authorize PSE&G to invest any other EV-related costs in addition to those associated with the three subprograms?

A. Yes. The Company was authorized to invest up to $6.2 million for EV-related IT upgrades.

Q. Did the CEF-EV Order authorize PSE&G to incur any incremental O&M costs?

A. Yes. The Board authorized the Company to incur and defer for future recovery the following O&M costs:

(i) $0.6 million for telematic tracking devices to understand residential charging behaviors of 500 customers;

(ii) $13.8 million for data acquisition costs for all deployed EV chargers for six years;

(iii) $8 million for marketing, education, and outreach to support the EV program; and

(iv) $16.6 million for O&M costs for all administrative services needed to support the EV program, including IT-related O&M.

III. COST RECOVERY

Q. Did the CEF-EV Order establish a method for the Company to account for and recover the costs of the CEF-EV Program?

A. Yes. The CEF-EV Order permitted the Company to establish two regulatory assets that allow it to defer for recovery in this rate case the capital and O&M costs of the CEF-EV program. Under the capital cost deferral, the Company is permitted to defer the capital costs of the CEF-EV program until those costs are rolled into rates in a future base rate case. The CEF-EV Order provided that subject to a prudence review of all CEF-EV costs, the Company's next base rate case would include a request for recovery of all prudently incurred costs associated with the CEF-EV program. Accordingly, in this case, the Company is proposing to recover the CEF-EV regulatory asset on CEF-EV related plant in-service that is or will be placed in service within six months of the end of the test year, as described in the testimony of Michael McFadden and set forth in Schedule MPM-17. Similarly, the Company is proposing recovery of the CEF-capital and O&M regulatory assets, over the same period as set forth in Mr. McFadden's schedule MPM-49.

Q. How did the Company estimate investment levels and costs of the CEF-EV program?

A. The Company estimates these investment and cost levels based on a forecast that models participation levels and growth rates from program inception and uses investment averages per site and per charger for the average number of chargers per site. The costs are based on project costs and participation levels to date with indexes such as inflation and cost of living increases factored into the forecast.

Q. How will the Company recover future CEF-EV program costs?

A. CEF-EV investment that is not likely to be in service by six months following the end of the test year (November 30, 2024), will be deferred and placed in a regulatory asset. Consistent with the CEF-EV Order, this case will remain open so that CEF-EV investments placed in service after November 30, 2024 may be reviewed and placed into rates through annual rate adjustment filings after the Board issues an order at the conclusion of this proceeding. The Company's proposal for the methodology and schedule of the annual rate adjustment filings is set forth in the testimony of Mr. Swetz.

IV. PROGRESS IN IMPLEMENTING CEF-EV PROGRAMS

Q. Please describe implementation of the CEF-EV program.

A. Following the issuance of the CEF-EV Order, PSE&G undertook and completed program development, including development of the IT architecture and coordination with billing processes and systems necessary to administer the program, including EV-specific options such as time-of-use rebates. PSE&G then launched the CEF-EV Program in a series of steps from June through September 2021, that included opening program enrollment applications, issuing demand charge rebates, and marketing and customer education activities.

Q. Following launch, please describe the enrollment levels in the various programs and the investment levels to date.

A. The program has been very successful to date and has exceeded expected enrollment levels for the overall program despite initial delays due in part to supply chain issues. As documented in the most recent semi-annual CEF-EV Program report that is included in Schedule KR-2, through June 2023, enrollments included 5,405 residential customers (5,640 chargers), 72 Mixed Use Commercial customers (143 chargers), and 41 DC fast charger customers (267 chargers). These amounts will be updated in a future Company update.

Q. Has the Company implemented the CEF-EV Program in a reasonable and prudent manner consistent with the CEF-EV Order?

A. Yes. In implementing its CEF-EV program, PSE&G has used first-come, first-served implementation (*i.e.*, not based on geographical area or other preference) to encourage early participation and to eliminate the risk of bias or favoritism. Also, the Company's program application process ensures, consistent with the CEF-EV Order, that all customers or EV stations receiving an incentive must be networked, meaning that the charging station is capable of sending and receiving communications via a wi-fi or cellular network. Moreover, the Company has worked collaboratively with the signatory parties to the Stipulation adopted by the Board in the CEF-EV Order to refine and obtain charging data that has permitted the Company to prepare the residential and non-residential cost-of-service studies that are being presented by Company witness Mr. Swetz in support of corresponding proposed rate changes proposed in this proceeding.

Q. Please describe the Company's approach to customer education, outreach, and marketing activities for the CEF-EV program.

A. PSE&G engaged the services of a marketing consultant to help develop and manage the marketing, education, and outreach of the CEF-EV Program. The vendor collaborates with the

Company to develop annual marketing plans that build upon the success of each previous year to market the program and educate customers most effectively. The overall marketing campaign included developing marketing materials in both digital and print, bill inserts, executing paid media ads, speaking at public conferences and EV-related webinars/seminars, and participating in multiple events such as National Drive Electric Week, Earth Day celebrations, and auto shows. Moreover, PSE&G actively participates in several EV organizations and has participated as speakers or panelists at multiple industry conferences and events.

Q. Is the Company proposing to use any public funding to offset the costs of the CEF-EV Program?

A. In accordance with the CEF-EV Order, PSE&G is committed to helping customers obtain all federal, state or local funding that can be used to offset the cost of the CEF-EV program. PSE&G's CEF-EV program web site's "FAQs" section advises potential participants that PSE&G incentives can be combined with other publicly funded EV incentive programs and includes links to other available State and Federal Programs.[5]

As part of the effort to maximize customers' cross-program participation the Company meets monthly with BPU Staff and the New Jersey Department of Environmental Protection ("NJDEP") to discuss implementation of the EV incentive programs managed by the Office of Clean Energy, NJDEP and the New Jersey Economic Development Authority "(NJEDA") that are available to customers alongside the utility-run programs. These meetings have resulted in the development of cross-promotional materials that have been posted on applicable State websites. Furthermore, PSE&G presented (virtually) to NJZIP stakeholders at a webinar scheduled by

[5] https://nj.myaccount.pseg.com/myservicepublic/electricvehicles

Rutgers University.[6] To the extent that any applicant for PSE&G's CEF-EV program receives public funding that, coupled with the incentives provided under the Company's program, results in a project being funded 90 percent or more, the Company will reduce its incentive funding and rebates to bring the total rebates and incentives under 90 percent of funding costs, though this scenario has rarely occurred.[7]

Q. Are there are any other steps that PSE&G takes to ensure that the costs of CEF-EV programs are reasonable?

A. Yes. PSE&G uses outside vendors to administer certain aspects of the program such as: data acquisition; marketing, education, and outreach; administrative program support; and application processing. When retaining outside vendors, PSE&G used a competitive bid process as part of the Company's procurement process to ensure the costs of procured services are reasonable. Moreover, all CEF-EV Program expenditures are subjected to an internal pre-approval review process that examines the cost prudency and appropriateness of the costs as part of the CEF-EV Program. As part of that process, the Company benchmarks against costs of similar services in other utility-led EV programs.

Q. In addition to the CEF-EV Order, are there other BPU requirements for utility EV incentive programs with which the CEF-EV program complies?

A. Yes. In April, 2023 the BPU issued an order directing the state's electric distribution companies including PSE&G to modify their respective EV programs to comply with the

[6] NJZIP is NJEDA's pilot EV incentive program that provides vouchers for medium-heavy duty EVs. *See* https://www.njeda.gov/njzip/ .

[7] The Company has reviewed 23 applications to date that have indicated receipt of public funding, and has had to reduce PSE&G's incentive on the basis of additional public funding only once. An additional 49 applications are pending review at this time.

requirements of the New Jersey Appliance Standards Law of 2022 (Appliance Act).[8] In compliance with this order, PSE&G added eligibility requirements for CEF-EV Program participants that EV chargers must be Energy Star certified.

Additionally, PSE&G requires program participants to provide charging data that PSE&G reports to the BPU in accordance with the November 2022 and November 2023 orders in the dockets establishing procedures for New Jersey electric distribution companies' basic generation service (BGS) auction requirements.[9]

Q. Does this conclude your direct testimony?

A. Yes. It does.

[8] *In the Matter of the Petition of Public Service Electric and Gas Company for Approval of Its Clean Energy Future Electric Vehicle and Energy Storage ("CEF-EVES") Program on a Regulated Basis*, BPU Docket No. EO18101111 (Order dated April 12, 2023). The Appliance Act is codified at N.J.S.A. 52:27D-141.18 – 141.24.

[9] *In the Matter of the Provision of Basic Generation Service (BGS) for the Period Beginning June 1, 2023* (Decision and Order, November 9, 2022) (requiring EDCs to collect and report charging data from both residential EV and DCFC charging stations including total energy consumed, capacity and transmission tags, measured demands, connected load, and the resulting load factor); *In the Matter of the Provision of Basic Generation Service (BGS) for the Period Beginning June 1, 2024*, (Decision and Order, November 17, 2023) (requiring EDCs to continue to report on the charging data specified in the prior year's order).

CREDENTIALS
OF
KAREN REIF
VICE PRESIDENT RENEWABLES AND ENERGY SOLUTIONS

My name is Karen Reif, and I am employed by Public Service Electric and Gas Company ("PSE&G", "the Company") as the Vice President of Renewables and Energy Solutions. In this role, I have primary management and oversight responsibility for the market strategy, development and implementation of the Company's solar, electric vehicle, energy storage, and energy efficiency programs.

EDUCATIONAL BACKGROUND

I have a Bachelor of Arts degree in International Studies from Emory University, and a Master of Business Administration in Finance and Strategy from Carnegie Melon University.

WORK EXPERIENCE

I have worked for PSE&G and its affiliate PSEG Services Corporation for 28 years in various positions. I have also worked for ScottMadden Management Consultants as a consultant. I joined PSEG in 1995. I have held multiple positions across the organization including various roles in trading, deregulated subsidiaries, information technology and most recently, continuous improvement. I spent 14 years in the Information Technology Department, holding several leadership roles including system implementation, business relationship management and project management/quality support. Prior to becoming Vice President of Renewables and Energy Solutions, I served as the Senior Director of Continuous Improvement for PSEG Services Corporation. I established this function for PSEG, which is responsible for developing sustainable and quantifiable business improvements based on industry best practices. In July of 2018, I was named Vice President of Renewables and Energy Solutions. My professional experience includes

finance, strategy, business relationships, application implementation, quality assurance, process management and program management.

I have the following certifications: Project Management Professional, Lean Six Sigma, and Information Technology Infrastructure Library Foundation. I was named a 2023 Return on Information New Jersey ("ROI-NJ") Woman in Business Influencer, a 2023 ROI-NJ Energy & Utilities Influencer, a MOVES Power Woman 2022 (New York Moves Magazine), and won the Tribute to Women in NJ ("TWIN") Award in 2015. I am also a board member of the Boys & Girls Club in New Jersey, the Children's Specialized Hospital Foundation, and the Rutgers Business School Advisory Board.

Clean Energy Future – Electric Vehicle (EV) Program

Semi-Annual Report to the Board of Public Utilities

H1-2021 – January through June 2021

Table of Contents

Section 1: Estimated Quantity of Work 3
Quantity of Work 3
Quantity Completed to Date 3
Section 2: DCFC Distribution Demand Charge Rebate 4
Program Usage 4
Funding Balance 4
Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs 5
Program Forecast 5
Capital Costs 5
O&M Expenses 5
Section 4: Financial Tables 6
Table 1: Summary of Program Investment & Expenses 6
Table 2: Investment by Cost Category 7
Table 3: Investment by Labor, Material & Other Costs 8
Table 4: Expenses by Cost Category 9
Table 5: Expenses by Labor, Material & Other Costs 10

Section 1: Estimated Quantity of Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: As of June 30, 2021, PSE&G has given no rebates for infrastructure development. PSE&G has invested in IT systems to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding;

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. PSE&G received 8 applications for the DCFC Distribution Demand Charge Rebate on June 30, 2021 that are under review.

Funding Balance

See Table 2 for the balance remaining of the $5 million rebate funding. No DCFC Distribution Demand Charge Rebates were issued this reporting period.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other.

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

Table 4: Program Expenses by Cost Category 9
Table 5: Expenses by Labor, Material & Other ("LM&O") Costs 10

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program ("CEF-EV Program").

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September, 2021 as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: As of December 31, 2021, PSE&G has invested a total of $4.2M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging ("DCFC") Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. Through December 31, 2021, PSE&G has enrolled 32 customers to the DCFC Distribution Demand Charge Rebate.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. As of December 31, 2021, PSE&G distributed $292,680 in demand charge rebates for this reporting period. There is $4.7M remaining in the funding.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021. As of December 31, 2021, the CEF Program has enrolled 218 residential customers, 5 Mixed Use Commercial customers, and 32 DCFC customers in the CEF-EV Program.

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

Table 1: CEF-EV Program Summary

Table 4: Program Expenses by Cost Category 9
Table 5: Expenses by Labor, Material & Other (“LM&O”) Costs 10

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program ("CEF-EV Program").

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September 2021 as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: As of June 30, 2020, PSE&G has invested a total of $7.3M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging ("DCFC") Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 3: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. Program to date, PSE&G has enrolled 33 customers to the DCFC Distribution Demand Charge Rebate, comprising of 242 chargers.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. As of June 30, 2022, PSE&G distributed $482,768 in demand charge rebates for this reporting period. There is $4.5M remaining in the funding.

Section 2: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021. As of June 30, 2021, the CEF Program has enrolled 670 residential customers (678 Chargers), 11 Mixed Use Commercial customers (17 Chargers), and 33 DCFC customers in the CEF-EV Program (242 Chargers).

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

Table 1: CEF-EV Program Summary

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial L2, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program ("CEF-EV Program").

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology (IT) architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September 2021 as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: Program to date, PSE&G has invested a total of $13M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging ("DCFC") Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021 with credits issued retroactive to program approval on January 27, 2021. Program to date, PSE&G has enrolled 35 customers to the DCFC Distribution Demand Charge Rebate, comprising of 252 chargers.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. Program to date, PSE&G distributed $628,777 in demand charge rebates, of which $210,532 was distributed this reporting period. There is $4.4M remaining in the funding. Year 3 of the credit will begin on January 27, 2023, with the distribution demand charge rebate adjusted from 75% to 50%.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021.

Program to date, the CEF Program has enrolled 1,974 residential customers (1,995 Chargers), 33 Mixed Use Commercial customers (63 Chargers), and 35 DCFC customers in the CEF-EV Program (252 Chargers).

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: Financial Tables

Table 7: DCFC EV Charging Data Summary 13

Section 1: Estimated Quantity of Make-Ready Work

PSE&G will provide semi-annual reports on the CEF-EV deployment ("CEF-EV Report") with the following information:

- Estimated quantity of work
- Quantity completed to date or, if the project cannot be quantified with numbers, the major tasks completed, e.g. Residential, Mixed Use Commercial, and DCFC Public Charging Make Ready to Charger Stub units completed and number of service upgrades:

Quantity of Work

See Table 1 for a summary of the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the Clean Energy Future – Electric Vehicle Program ("CEF-EV Program").

Major Tasks Completed: Following Board approval on January 27, 2021, PSE&G initiated program development, including Infrastructure Technology ("IT") architecture. PSE&G launched the CEF-EV Program in a series of steps from June through September 2021. Since that time PSE&G has continued to enroll eligible customers as discussed in detail in each subprogram below.

Quantity Completed to Date

See Table 2 for the capital costs per subprogram, indicating the work completed to date.

Quantity Completed: Since program inception, PSE&G has invested a total of $21M in CEF-EV Program investment. This includes investment for the following three subprograms: (i) Residential Smart Charging Program, (ii) Level-2 Mixed Use Charging Program, and (iii) a Direct Current Fast Charging ("DCFC") Program, which also includes investment in Distribution Demand Charge Rebates. The CEF-EV Program further includes cross-program investments for IT system upgrades to support the deployment of the CEF-EV program and the development of associated customer platforms.

Section 2: DCFC Distribution Demand Charge Rebate

The semi-annual reports will include the following information:

- The usage of the rebate funding
- The balance remaining of the $5 million rebate funding

Program Usage

The application and agreement form for the DCFC Distribution Charge Rebate for pre-existing sites was launched on June 15, 2021. Program to date, PSE&G has enrolled 41 customers to the DCFC Distribution Demand Charge Rebate, comprising of 267 chargers.

Funding Balance

See Table 2 for the usage and balance remaining of the $5 million rebate funding. Since program inception, PSE&G distributed $780,571 in demand charge rebates. There is $4.2M remaining in the funding.

Section 3: Semi-Annual and Program To-Date Forecast and Actual Costs

The semi-annual reports will include the following information:

- The forecasted and actual capital costs
- The forecasted and actual O&M expenses

The project expenditures shall be broken out between labor, material, and other costs.

Program Forecast

See Table 1 for the period-to-date, program-to-date, and forecasted capital costs and O&M expenses for the CEF-EV Program.

Capital Costs

See Table 2 for the actual capital costs by cost category and Table 3 for the capital costs broken out between labor, material and other ("LM&O").

Program enrollment for make-ready funding was implemented in phases. The DCFC subprogram was launched on July 23, 2021. The Level 2 Mixed-Use Commercial subprogram was launched on July 30, 2021. The Residential make-ready subprogram was launched on September 15, 2021. Since program inception, the CEF Program has enrolled 5,405 residential customers (5,640 Chargers), 72 Mixed Use Commercial customers (143 Chargers), and 41 DCFC customers in the CEF-EV Program (267 Chargers).

O&M Expenses

See Table 4 for the actual expenses by cost category and Table 5 for the expenses broken out between labor, material and other.

Section 4: EV Charging Data Summary

The CEF-EV Program semi-annual report will include a submittal of the following data:

- Residential EV Charging Data
- Direct Current Fast Charging ("DCFC") Data

The submittal will provide the total energy consumed, capacity and transmission tags, measured demands, connected load, and the resulting load factor.

Residential EV Charging Data

The Residential EV charging data is summarized in Table 6.

DCFC Data Definitions

The DCFC EV charging data is summarized in Table 7.

PUBLIC SERVICE ELECTRIC AND GAS COMPANY
DIRECT TESTIMONY
OF
DAVID JOHNSON
VICE PRESIDENT – CUSTOMER CARE AND
CHIEF CUSTOMER OFFICER PSE&G

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is David Johnson. My business address is 80 Park Plaza, Newark, New Jersey, 07102.

Q. In what capacity are you employed?

A. I am currently employed by Public Service Electric and Gas Company ("PSE&G" or "Company") as Vice President Customer Care and Chief Customer Officer (COO). I have over 25 years of experience in customer service for energy providers. For example, I previously served as CCO for Duquesne Light Company in Pittsburgh, PA, Vice President for Customer Service at Entergy Louisiana and Senior Vice President of Customer Service at DTE Energy. In my current role, I am responsible for the successful deployment of the CEF-EC program and operationalizing the AMI capabilities that result from this program. Implementation of the CEF-EC program and AMI functionalities involve many of the areas that I oversee including billing, meter reading, collections, customer experience and the contact center.

Q. What is the purpose of your direct testimony?

A. As part of PSE&G's 2023 base rate filing with the New Jersey Board of Public Utilities ("BPU" or "Board"), the purpose of my testimony is to provide information that will support a finding by the Board that the investments and expenditures made by PSE&G for its Clean Energy Future – Energy Cloud ("CEF-EC") program are prudent and reasonable. The CEF-EC costs that

the Company proposes to recover in this proceeding are the investments placed in service by November 30, 2024, six months after the end of the test year, as well as the regulatory asset balances of the CEF-EC Infrastructure Deferral, Stranded Cost Deferral and Operation and Maintenance ("O&M") regulatory assets that have been established in accordance with the Board's January 7, 2021 Order in BPU Docket No. EO18101115 that authorized the CEF-EC program and establishment of the CEF-EC regulatory assets.[1] The accounting and cost recovery for the program and the treatment of depreciation are described in the testimony of Company witness Mr. Michael McFadden.

Q. Do you sponsor any schedules as part of your direct testimony?

A. Yes. I sponsor the following schedules that were prepared or compiled under my direction and supervision.

(1) Schedule DJ-1 sets forth my credentials;

(2) Schedule DJ-2 provides the CEF-EC semi-annual reports that have been submitted to BPU Staff to date.

II. THE COMPANY'S CEF-EC PROGRAM AND CURRENT STATUS

Q. Please describe the Company's CEF-EC Program that was approved by the Board in its CEF-EC Order.

A. By Order dated February 19, 2020, the Board found that AMI is a means to achieve the objectives of the 2019 Energy Master Plan ("EMP").[2] Accordingly, the Board directed PSE&G

[1] *I/M/O The Petition of Public Service Electric and Gas Company for Approval of Its Clean Energy Future – Energy Cloud ("CEF-EC") Program on a Regulated Basis*, BPU Docket No. EO18101115, "Decision and Order Approving Stipulation" (January 7, 2021) ("CEF-EC Order").

[2] *In re the Petition of Rockland Electric Company for Approval of an Advanced Metering Program, and for Other Relief*, BPU Docket No. ER16060524 (February 19, 2020).

and other utilities to file petitions for AMI implementation. In the CEF-EC Order, the Board authorized the Company to install approximately 2.2 million Advanced Meter Infrastructure ("AMI") meters at an estimated investment cost of up to $707 million for the advanced meters, network infrastructure and associated information technology required to implement Release 1 of the CEF-EC program. The Company planned to install AMI meters over the period 2021 to 2024 in accordance with the following schedule:

2021	80,000 meters
2022	300,000 meters
2023	900,000 meters
2024	900,000 meters

Under the CEF-EC Order the Company had the right to accelerate this deployment schedule to effectuate the efficient deployment of AMI meters. The Company began installing AMI meters during 2021 and 2022 according to this plan and, beginning in 2023, conducted an accelerated geographic strategic deployment in which the Company divided its service territory into three separate regions and employed a strategy to identify and group meters for replacement on a daily basis. The Company utilized its existing manual meter reading assignments to develop a deployment strategy to support the efficient deployment of AMI meters and consolidation of meter reading assignments.

Q. What is the current status of PSE&G's AMI installation project?

A. The project is currently ahead of its installation schedule and under the program budget.

Q. What is the status of the AMI network installation and functionality?

A. The Company completed installation of its Landis + Gyr Network ("Network") in June 2022, and 100 percent of the Network was communicating by September of 2022.

Q. How many AMI meters have been installed so far?

A. As of November 30, 2023, 1,270,091 residential and 178,615 commercial AMI meters have been installed, for a total of 1,448,706. Thus, the Company has already exceeded the planned installation of 1,280,000 AMI meters by the end 2023 that is included in the CEF-EC Order. Installations are expected to continue ahead of pace.

Q. Is the Company projecting to complete full AMI deployment within six months beyond the end of the rate case test year (by November 30, 2024)?

A. At this time, yes, PSE&G projects full deployment will be accomplished by November 30, 2024, and possibly could be accomplished earlier.[3] Certain factors that are difficult to predict may impact the timing, such as new supply chain issues, or other issues impacting PSE&G's ability to obtain AMI meter inventory or impacting the labor force. Based on current conditions, the Company expects to finish ahead of schedule.

Q. What are program costs compared to the program forecast as of September 30, 2023?

A. Total actual costs as of September 30, 2023 were approximately $310 million (approximately $278 million for capital and $32 million for O&M). PSE&G forecasts total costs of the Program upon completion in November 2024 to be $625 million (approximately $570 million for capital and $55 million for O&M) well below the approved amount of up to $779 million ($707 for capital and $72 for O&M).

Q. How has PSE&G managed implementation of the CEF-EC program to deliver the program to date significantly under the forecast budget?

A. PSE&G has achieved numerous meter deployment efficiencies by implementing the following strategies.

[3] With the exception of customers who elect to opt out of an AMI meter.

Successful customer communications ahead of meter changes has resulted in an approximate 90% success rate of changing the meter on the first visit. Making only a single visit to a customer location has reduced the need for appointments and unscheduled visits, which, by nature, are less productive and more costly.

Additionally, PSE&G has worked closely with the meter installation vendor to optimize meter change routes. The meter change schedule was organized by "sectors," which are geographic areas. Each sector was carefully designed to reduce travel time both within each sector and to the various warehouses and laydown yards.

PSE&G's internal workforce has also taken advantage of "opportunistic" meter changes on customers' premises. In other words, as PSE&G has been visiting customer homes to address meter-related issues, such as non-registering meters or high bill complaints, PSE&G has taken the opportunity to replace the existing meter with an AMI meter at that visit. This eliminates the need for a separate, future visit just to change that customer's meter.

III. BENEFITS OF CEF-EC PROGRAM INVESTMENTS

Q. Recognizing that the Company has not concluded the implementation of its CEF-EC program, have the benefits of the program identified previously by PSE&G begun to be realized?

A. Yes. PSE&G's CEF-EC program strategy prioritized delivering the benefits of AMI meters to customers as soon as possible following AMI meter installation. The program currently is delivering substantial benefits to customers. Some benefits have been, or are expected to be, achieved ahead of the forecast schedule for delivery.

Q. Please generally explain AMI customer benefits and the expected timing of achieving these benefits.

A. As a result of PSE&G's CEF-EC program deployment design, some customer benefits are already active, such as billing on actual usage transmitted by the AMI meters, and remote capabilities such as move in/move out and disconnect/reconnect.

Additionally, as set forth in the CEF-EC Order, other benefits are achievable over longer periods. In the October 11, 2018 filing to implement the CEF-EC program, the Company proposed a program that would implement 22 out of a total of 70 potential AMI functionalities or "Use Cases" that focused on customer engagement, network operations and planning, and new utility products and services.[4] PSE&G committed in the stipulation of settlement approved by the CEF-EC Order to use "best efforts" to provide the AMI capabilities of the 22 Use Cases within the approved program budget, and the parties recognized that, "these capabilities may not be available until after the full deployment if the AMI meters is complete."[5]

Notwithstanding, PSE&G's CEF-EC program to date has already accomplished deployment of multiple Use Cases that benefit all customers by improving the efficiency of operations and reducing truck dispatches that would previously have been required to perform move in/move out and reconnects.

[4] Those 22 use cases were referred to as "Release 1." *See* CEF-EC Order at Stipulation ¶ 3. The remaining 48 Use Cases were generally described in PSE&G's AMI cost-benefit analysis that accompanied its 2018 filing, and could be proposed as part of future program proposal filings but are not included in the budget or implementation of the currently approved CEF-EC Program.

[5] CEF-EC Order at Stipulation ¶ 17.

Q. Beginning with the most basic AMI functions, when AMI meters are installed, when does data begin to communicate with the Company's systems, and is the AMI data being used for billing?

A. PSE&G's primary goal for the CEF-EC program is that after each meter is installed, the customer will receive an accurate bill utilizing an AMI meter read. Following installation of a meter, PSE&G verifies that the meter is communicating with the Company's systems. After three successful days communicating, the billing system utilizes the AMI read to bill the customer. The Company has achieved a sustained AMI actual read billing rate of over 99 percent. Where there have been a small number of communication issues, these are addressed expeditiously.

Q. Regarding the 22 Use Cases, please provide an overview and the status of their deployment.

A. These 22 Use Cases and deployment status are as follows:

Use Case #	Use Case Name	Deployment Status	Use Case Overview & Value
1,2,3,4	1. Enhanced Customer Engagement & Communications	**Deployed Q3, 2023** (customer access to usage data via portal) **Deployment scheduled Q2, 2024** (enable customer inquiries via portal)	A set of customer benefiting functions and analytic applications that provide visualizations and analytics across a variety of customer and iESP data combined with other data – bills, usage, prices, tips, alerts, energy efficiency, appliance profiles, new products and services, notifications, and available through mobile and web portals.
	2. Rate Analyzer & Comparator	**Deployment scheduled Q3, 2024**	
	3. Usage & Bill Alerts, Saving Tips, Interactive Bill Presentment	**Deployment scheduled Q2, 2024**	
	4. Interactive Energy Demand & Bill Management (Portal part of Meter Data Management System - MDMS project)	**Deployment scheduled Q2, 2024**	
5	Customer Segmentation & Behavioral Analysis	**Deployed Q4, 2023** (pull system) **Deployment scheduled Q2, 2024** (push system)	Provides the ability to develop highly targeted customer segmentation models based on more granular energy usage data and customer interactions to improve customer service, marketing, time of use ("TOU") rates, new products and services, and planning load forecasts. Capability depends on data integration to PSE&G systems to enable usage via "pull system" and "push system"

Use Case #	Use Case Name	Deployment Status	Use Case Overview & Value
6	Customer Power Quality	**Deployment scheduled Q3, 2024**	Capability that allows PSE&G to obtain voltage, load, and alert data directly from the meter to analyze customer power quality issues (flicker, sag, swell), without the need for further instrumentation, and can also help ensure appropriate corrective actions are taken (utility or customer side of the meter).
7	Customer Energy Efficiency Programs (Thermostats & Supporting CEF-EE Filing)	**Deployed Q4, 2023**	iESP data gives the customer the ability to make more educated energy efficiency related decisions, change energy consumption habits, and ultimately lower utility bills. This is enabled by providing customers with detailed iESP data through web or mobile portals, smart devices and in-home devices. PSE&G can also use this iESP data to design and offer energy efficiency products and services.
8	Customer Service & Call Center Performance	**Deployment scheduled Q3, 2024**	Enables the use of broader range of information (including iESP) to increase call center knowledge, improve service, improve customer satisfaction, and lower customer costs by bringing together historical and real-time information to support decision analysis and improve the customer experience.
9	Customer DER/PV/EV	**Deployed Q4, 2023**	Services and systems that will use iESP data to help assist customers with DER (solar, EV, energy storage) installations and the management of any power quality issues that occur as a result of variable DER load
10	Customer Device Safety	**Deployment scheduled Q3, 2024**	Enhances customer safety by using iESP data, such as alerts and voltage data to detect safety issues relating to customer meters and power connections such as hot sockets and fallen wires, and provide alerts to customers and PSE&G.
11	iESP Sensor, Network & Data Operations	**Deployed Q3, 2023**	Back office processes and systems that manage the initial iESP infrastructure deployment and the ongoing and updated Meter Operations business function including acquisition, warehousing, testing, installation, maintenance, data streams and quality, alarm management, and meter data management.
12	Automated Move in/Move out & Remote Disconnect/ Reconnect	**Deployed Q3, 2023**	This use case addresses the messages exchanged between Customer Operations processes and Smart Meter through the HeadEnd and Network when a customer move in or out request is issued by Customer Operations or other customer processes. PSE&G currently sends a metering service employee to move a customer in or out for a variety of reasons. With iESP, the turn on functions and on demand read functions to support these processes can be automated and performed remotely and instantaneously, thereby increasing customer satisfaction and efficiency across various customer processes. • Electric operations reduction due to MIMO and Collection activity automated. • Gas operations reduction due to remote MIMO and Collection activity automated: • Cost reduction due to 85k avoided truck roll costs for move in move outs
13	Remote Disconnect/ Reconnect	**Deployed Q3, 2023**	This use case addresses the messages exchanged between Customer Operations processes and Smart Meter through the HeadEnd and Network when a meter connect/disconnect request is issued by Customer Operations or other processes. PSE&G currently sends a metering service or collections employee to connect or disconnect the meter for a variety of reasons. With iESP, the reconnect/disconnect functions to support these processes can be automated and performed remotely and instantaneously, thereby increasing customer satisfaction and efficiency across various customer processes.

Use Case #	Use Case Name	Deployment Status	Use Case Overview & Value
			• Electric operations reduction due to remote turn-on/off of electric meters • Gas operations reduction due to remote turn-on/off of gas meters: • Cost reduction due to 171k avoided truck roll costs for move in standard turn on/turn offs • Cost reduction due to avoided truck roll costs for turn on/turn off type events • Reduction in writes offs due to energy consumed on inactive accounts. Being able to remotely detect and disconnect will reduce the occurrence. $20m written off yearly. Assuming 70% reduction due to iESP capabilities
14	Next Generation Meter-to-Cash	**Deployed Q3, 2023** (enables billing department to provide revised bills via AMI data) **Deployment scheduled Q3, 2024** (obtain missing interval reads)	With more granular and quality iESP data available, alongside numerous other internal data sources, PSE&G can optimize and re-invent their meter-to-cash processes and drive out inefficiencies, increase service, and reduce costs. The iESP data is significantly more accurate at the source and by mapping the data from the iESP to its end use, leakage can be detected more easily. The cost of these losses is spread across the customer base so any improvement ultimately reduces customer bills. • Billing cost reduction due to a decline of billing irregularities and analysis work • Collection cost reduction due to a decline of backoffice collection workload • Reduction in bad debt due to improvement in field collections. Being able to remotely detect and disconnect will reduce the occurrence. $60m written off yearly. Assuming 31% reduction due to iESP capabilities
15	Network Connectivity Analysis	**Deployment scheduled Q2, 2024**	PSE&G's electricity network is complex, covers a large area, and provides power to different customers at different voltage levels. Ensuring that the required sources and end-use loads are correctly represented in operations systems is often very difficult. The iESP end-point meters can extend the network model and enable a high level of accuracy of connections and phasing, which in turn results in better planning and operations performance, and enables many other network dependent use cases.
16	Outage Detection & Analysis	**Deployment scheduled Q2, 2024**	Uses outage data from operations systems and smart meters to identify and verify possible outage locations, as well as identify network sections and specific customers (and numbers) that are out of power. This data is provided and displayed in real-time, to allow analysis, fast response, and crew dispatch to the precise location (down to meter) with information on the potential cause of the outage in order to more quickly restore power and ensure all customers are restored.
17	Outage Response Notification (ETR)	**Deployment scheduled Q2, 2024**	Use iESP outage data to calculate and communicate reasonable, more accurate, and acceptable outage status and restoration times to customers in real time. This largely eliminates one of the most common customer complaints about utility service, *i.e.,* inaccurate estimated restoration times. Messaging solutions within scope of this use case include Interactive Voice Response (IVR), web portals, text messaging, social media, mobile applications, and press releases.

Use Case #	Use Case Name	Deployment Status	Use Case Overview & Value
18	Voltage Monitoring & Analysis	**Deployment Q3, 2024**	Using iESP data and other network data sources, voltage readings are captured, visualized, and system-wide analysis is run to determine locations where voltage violations exist both above and below nominal voltage. Utilities can utilize this information for accurate analysis of voltage issues and a base for voltage planning and optimization across the network. Further, this information can help planners identify strategic locations for deployment of Volt/VAR optimization equipment.
19	Asset Load/Phase Management, Balancing & Power Analysis (incl. Transformer Load Monitoring & Customer Load Curtailment/Limiting)	**Deployment scheduled Q3, 2024**	Using iESP data and other network data sources, load data is imported, aggregated, and visualized. Power flow analysis is run to examine and monitor loading profiles of every network asset along the feeder from the substation to the smart meter. This use case gives visibility of loading profiles and load flows of all network assets and customers with real-time or overnight iESP data updates. This information can be used by planners and operators to determine areas of overloading of assets on the system, plan responses to major events, execute asset balancing, and customer load curtailment.
20	Load Profiling & Forecasting	**Deployment scheduled Q3, 2024**	Capability that would enhance load profiles and forecasts by using iESP data in combination with network, customer billing or other data (*e.g.*, weather) to perform more detailed usage analysis. This is beneficial to customers and PSE&G planners by supporting optimized planning of load growth, which in turn leads to optimized capital spending and reliability of the network.
21	Distribution Losses	**Deployment scheduled Q3, 2024**	Distribution losses can be identified by comparing the iESP end-point meter usage data with usage data at the distribution entry point (*i.e.*, substation). Areas of high losses or network sections with particularly high losses can be identified through the analysis. Further analysis on the causes of the high losses will shed light into the different types of corrective / mitigating actions that can be taken to reduce the technical losses. Technical losses are spread across the customer base, so any improvement in this area could reduce customer bills.
22	Revenue Protection & Assurance	**Deployment scheduled Q3, 2024**	Revenue protection refers to the prevention, detection, and recovery of losses caused by interference with or theft of utility service. This use case will leverage smart meter consumption, as well as voltage and event data, to detect energy theft and meter tampering by employing multiple screening techniques, including cross-service correlations. Energy theft is spread across the customer base, so any improvement reduces customer bills.

Q. Please identify the Use Cases that have already been deployed.

A. PSE&G has already deployed or partially deployed the following 8 Use Cases:

- Use Case 1: Enhanced Customer Engagement
- Use Case 5: Customer Segmentation & Behavioral Analysis
- Use Case 7: Customer Energy Efficiency Programs
- Use Case 9: Customer DER/PV/EV

- Use Case 11: Sensor, Network & Data Operations
- Use Case 12: Automated Move in/Move out & Remote Disconnect/Reconnect
- Use Case 13: Remote Disconnect/Reconnect
- Use Case 14: Next Generation Meter to Cash

Q. Please describe the benefits currently being realized as a result of the installation and general functionality of installed AMI meters, use of the AMI meter data for billing, and the 8 Use Cases deployed to date.

A. Benefits of the CEF-EC program currently being realized through the CEF-EC program to date can be grouped as follows: meter reading/meter accuracy; benefits derived from remote capabilities; revenue integrity benefits; collections benefits; and customer access to their AMI data. I will generally describe each of these benefit types below:

Meter Reading/Meter Accuracy

Operational and customer benefits result from reduced labor and costs of meter reading and increased accuracy of bills due to a higher meter reading rate due to AMI. Please reference the Company' semi-annual reports in Schedule DJ-2 for meter read rates attributable to AMI.

Remote Capabilities

Currently remote meter reading, remote move-in/move-out, and remote disconnect/reconnect functionalities are enabled and are being used via installed AMI meters. Operational benefits from these functionalities include reduced costs through eliminating the need to dispatch trucks, and the efficiencies of completing these tasks remotely. Through the third quarter of 2023, there have been 10,000 reconnects following disconnection for non-payment completed remotely, avoiding a truck dispatch and greatly reducing the customers' wait time to be reconnected. Additionally, there have been over

125,000 move-ins and move-outs completed remotely (meter reads, turn-ons, and turn-offs). There are also tangential environmental benefits because reducing the need to dispatch a truck reduces the overall greenhouse gas emissions from vehicles.

Collections Benefits

Field collectors now have the ability to disconnect an AMI meter remotely when they update a collection order on their hand-held device. This improves their efficiency and effectiveness. Before having remote turn-on and turn-off capability, the effective rate for a field collector visit was 28%.[6] Since the addition of this capability, the effective rate for a field collector on visits with AMI meters is 88%. There have been over 23,000 move-ins and move-outs remotely turned on and off, resulting in the reduction of unknown accounts and the revenue associated with these accounts (a subset of total remote move-ins/move-outs). In the future, this will result in reduced bad debt expense related to unknown revenues.

Customer Access to Their Data

Customers with AMI meters have access to PSE&G's AMI portal. The portal allows customers to view their usage, set usage threshold alerts, and access existing energy savings tips. The portal available to residential customers also has additional information about home energy assessments.

[6] A field collector visits is typically considered "effective" if it results in either a payment or a shut-off.

Q. Has the Company realized any additional benefits simply by virtue of replacing existing meters?

A. Yes. PSE&G's observations during meter replacement have resulted in PSE&G investigating 9,134 cases of tampering through September 30, 2023. This yields a direct customer benefit, as detecting tampering reduces the costs of theft from meter tampering.

Q. Will AMI meters assist the company in detecting metering tampering and theft going forward?

A. Yes. As described in the table above, the current plan is to deploy an analytical tool by the end of the third quarter of 2024 that will enable identification of potential theft more quickly.

Q. Has the Company implemented the CEF-EC program in a manner consistent with the CEF-EC Order and with regard to customers wishing to opt-out of AMI meters?

A. Yes. The Company has complied with applicable reporting requirements and attempted to implement the program as efficiently as possible. The semi-annual reports submitted to the BPU are attached hereto as Schedule DJ-2. Additionally, the Company has implemented the CEF-EC program in a manner consistent with the CEF-EC Order that fully recognized the rights of customers to opt out of the program. As of November 30, 2023, only 5,559 customers opted out of the AMI meter. This is an opt-out rate of less than one-half of one percent.

Q. Is the Company proposing in this case a change to the manual meter reading fee as was permitted by the CEF-EC Order?

A. No. The CEF-EC Order permits PSE&G to "provide testimony and actual cost information for these fees in its Next Base Rate Case, at which time these fees will be subject to review and modification."[7] However, and in order to achieve an equitable and appropriately non-discriminatory result for all customers, PSE&G is not currently collecting the manual meter-

[7] CEF-EC Order at Stipulation ¶ 31.

reading fees from opt-out customers. Therefore, there is not yet sufficient data to present in this matter regarding the actual costs based on all opt-outs that would support a change in the fee established in the CEF-EC Order. The CEF-EC Order states that "ongoing review and assessment of these fees will be subject to review and modification in future rate cases;" therefore, PSE&G anticipates it will present data related to actual costs of manual meter reads for the entire population of opt-outs in its next rate case.[8]

Q. How does PSE&G communicate these fees to customers that have chosen to opt out?

A. Any customer opting out was notified during the opt-out process that the $12 fee will begin to apply in 2024. PSE&G also intends to send each such customer a letter providing the opportunity to opt back in before PSE&G starts charging the fee. Any customer that opts back in will not be charged a fee.

Q. When will PSE&G begin charging customers the opt-out fees?

A. PSE&G will begin charging a customer an opt-out fee only after PSE&G sends that customer the letter described above providing that customer an opportunity to opt back in.

Q. The CEF-EC Order also established a one-time opt out fee for customers wishing to remove an AMI meter that was previously installed. Is PSE&G currently charging this fee?

A. Yes. PSE&G is currently charging this fee.

[8] *Id.*

IV. ACCOUNTING AND COST RECOVERY FOR CEF-EC PROGRAM

Q. Did the CEF-EC Order establish a method for the Company to account for and recover the costs of the CEF-EC program?

A. Yes. The CEF-EC enables accelerated installation of AMI meters and retirement of legacy and non-AMI meters before they are fully depreciated. The prudence of the costs included in these regulatory assets is subject to review by the Board in this case. The Order provided that until the costs of the CEF-EC programs were rolled into base rates, AMI-related capital costs, legacy meter stranded costs, and AMI-related O&M costs would be deferred and placed in regulatory assets as separate and identifiable accounts. Specifically, the details are shown on Schedule MPM-16, the proposed amortization of the CEF-EC deferrals are shown on Schedule MPM-47, and the *pro forma* revenue requirement adjustment is shown on Schedule MPM-48.

Q. How are the projected O&M savings related to the CEF-EC Program reflected in the Company's filing?

A. In accordance with CEF-EC Order, PSE&G will include a reduction for future O&M savings after the test year. As described in Mr. McFadden's testimony, the Company is proposing a *pro-forma* adjustment to its revenue request in this proceeding to account for future O&M savings resulting from AMI that are not reflected in the test year and is shown on Schedule MPM-48.

Q. Does this conclude your direct testimony?

A. Yes. It does.

Executive Profile

David L. Johnson

Vice President Customer Care and Chief Customer Officer

Public Service Electric & Gas Company

David L. Johnson was named vice president – Customer Care and chief customer officer at PSE&G effective July 2022. In his role, Mr. Johnson is responsible for leading, planning and managing PSE&G's efforts to deliver a seamless and efficient customer service experience, driven by a customer-centric culture. He is responsible for setting the agenda for how the company interacts with customers as well as creating a mindset of continuous improvement to ensure the company is on par with changing customer demographics and expectations.

Mr. Johnson has over 20 years of experience in customer service for energy providers. Mr. Johnson previously served as CCO for Duquesne Light Company in Pittsburg, Pa. and vice president, Customer Service for Entergy Louisiana, where he led day-to-day customer service operations and established and maintained relationships with customers and community stakeholders.

Prior to joining Entergy Louisiana, he was senior vice president, Customer Service and Economic Development, for DTE Energy in Michigan, where he spent most of his career. At DTE Energy, Mr. Johnson led a call center transformation, installation of a new billing system, improved cash collections and built a very solid relationship with internal and external stakeholders.

Mr. Johnson holds a Bachelor of Science degree in accounting from Lawrence Technological University. He is a 2001 graduate of Leadership Michigan and is an active mentor and career coach for young and developing professionals.

Mr. Johnson has served on the boards of several non-profit organizations including Vibrant Pittsburgh, Pittsburgh Symphony Orchestra, Children's Hospital of Michigan, Accounting Aid Society, Junior Achievement, United Way 211 and others. In 2007, he was acknowledged as one of the San Antonio Chamber of Commerce's "Top 40 Under 40." In 2013, he received the highly esteemed "Men of Excellence" award from the Michigan Chronicle. His professional membership includes the American Association of Blacks in Energy.

In his free time, Mr. Johnson is a self-professed classic car lover and enjoys spending time with family.

Clean Energy Futures-Energy Cloud

Advanced Metering Infrastructure (AMI) Program

Semi-Annual Report to the Board of Public Utilities

For the period January 1, 2021-June 30, 2021

Reporting Metric Tables:

Metric Description	Jan-21	Feb-21	Mar-21	Apr-21	May-21	Jun-21	Current Reporting Period 1/1/2021-6/30/2021	Project to Date
Residential Meters Installed	17	1,975	3,613	4,177	6,457	6,880	23,119	23,119
Commercial Meters Installed	2	63	169	314	861	1,151	2,560	2,560
Poles Installed	0	0	0	0	0	0	0	See Note A
Three-radio Network gateways installed	0	0	0	0	0	0	0	See Note A
Single-radio Network gateways installed	0	0	0	0	0	0	0	See Note A

Stranded Costs Deferred			**N/A**	**See Note H**

N/A – Not applicable at this stage of the AMI Program

Reporting Metric Notes:

A. Network Installation

Estimated Quantity of Work: 161 new poles and three radio gateways, 47 single-radio network gateways and 2207 routers are estimated to be installed beginning in July 2021 with completion by mid-2022 to support the expansion of the existing RF Network

B. Percentage of Network Communicating to L+G Platform

Estimated Quantity of Work: 100% installation of network to be completed by mid-2022

C. Actual Reads Recorded from AMI Meters

Actual read number is inclusive of large commercial AMI meters installed prior to start of current AMI Project

D. Customers who have authorized third party supplier access to their energy usage data

The development of a Data Access Plan has been deferred pending the statewide proceeding in Docket No. EO20110716. On August 23, 2021, in that docket, the BPU issued a Straw Proposal on Advanced Metering Infrastructure (AMI) Data Transparency, Privacy & Billing, and has sought written comment from all interested parties by October 7, 2021. Per that August 23, 2021 notice, after submission of comments, Board Staff anticipates having one or more stakeholder meetings to discuss that feedback and, once all feedback is received, Staff expects to recommend that the Board approve an MFR order on data access, among other things, which will be followed by a rulemaking proceeding to codify the requirements placed on each electric public utility with an AMI deployment plan. PSE&G is participating in that Board Staff proceeding.

E. Third Party Customer Engagement Efforts

PSE&G has utilized social media outlets for third party customer engagement efforts to date. The activities and results are as follows:

1. Published 17 messages:

a) *2 paid Facebook ads,*

b) *15 organic messages on Facebook, Twitter and LinkedIn:*

(1) 5 on Facebook,

(2) 9 on Twitter,

(a) 7 on PSEGDelivers,

(b) 2 on PSEGNews.

c) 1 on LinkedIn

2. Channel followers (as of July 2021):

a) *Facebook: 116,659*

b) *PSEGDelivers (Twitter): 101,704 followers*

c) *PSEGNews (Twitter): 20,418*

d) *LinkedIn: 55,182*

3. The social media posts generated:

a) *2,355,520 impressions (how many times an AMI social message was displayed),*

b) *Reached 797,462 Facebook users*

F. Remote Connects/Disconnects Performed

Use case not yet implemented

G. AMI Metering Tampering Cases

Use case not yet implemented

H. Stranded Costs Deferred

Expected to be available for next reporting period

Clean Energy Future-Energy Cloud

Advanced Metering Infrastructure (AMI) Program

Semi-Annual Report to the Board of Public Utilities

For the period July 1, 2021-December 31, 2021

Reporting Metric Tables:

Metric Description	Jul-21	Aug-21	Sep-21	Oct-21	Nov-21	Dec-21	Current Reporting Period 7/1/2021-12/31/2021	Project to Date 1/7/2021 - 12/31/2021

Stranded Costs Deferred	**N/A**	**N/A**	**See Note I**	**See Note I**

N/A – Not applicable at this stage of the AMI Program

Reporting Metric Notes:

A. Network Installation

Estimated Quantity of Work: 161 new poles and three radio gateways, 47 single-radio network gateways and 2207 routers are estimated to be installed beginning in July 2021 with completion by mid-2022 to support the expansion of the existing RF Network

B. Percentage of Network Communicating to L+G Platform

Estimated Quantity of Work: 100% installation of network to be completed by mid-2022

C. Actual Reads Recorded from AMI Meters

Actual read number is inclusive of large commercial AMI meters installed prior to start of current AMI Project

D. Customers who have authorized third party supplier access to their energy usage data

The development of a Data Access Plan has been deferred pending the statewide proceeding in Docket No. EO20110716. On August 23, 2021, in that docket, the BPU issued a Straw Proposal on Advanced Metering Infrastructure (AMI) Data Transparency, Privacy & Billing, and sought written comment from all interested parties by October 7, 2021. Per that August 23, 2021 notice, after submission of comments, Board Staff anticipates having one or more stakeholder meetings to discuss that feedback and, once all feedback is received, Staff expects to recommend that the Board approve an MFR order on data access, among other things, which will be followed by a rulemaking proceeding to codify the requirements placed on each electric public utility with an AMI deployment plan. PSE&G is participating in that Board Staff proceeding.

E. Third Party Customer Engagement Efforts

PSE&G has utilized social media outlets for third party customer engagement efforts to date. The activities and results are as follows:

1. Published 6 messages:

a) *6 organic messages on Facebook, Twitter and LinkedIn:*
   (1) 1 on Facebook,
   (2) 4 on Twitter,
      (a) 3 on PSEGDelivers,
      (b) 1 on PSEGNews.
   (3) 1 on LinkedIn.

2. Channel followers (as of December 2021):

a) *Facebook: 118,251*
b) *PSEGDelivers (Twitter): 101,942*
c) *PSEGNews (Twitter): 20,673*
d) *LinkedIn: 57,213*

3. The social media posts generated:

a) *18,523 impressions (how many times an AMI social message was displayed),*
b) *Reached 7,242Facebook users*

F. Remote Connects/Disconnects Performed

Use case not yet implemented

G. AMI Metering Tampering Cases

Use case not yet implemented

H. Stranded Costs Deferred

Expected to be available in future reports.

CEF-EC Deferred O&M Expenses – Other	$3.1M	$6.72M	$5.42M	$9.04M
Stranded Costs Deferred	**N / A**	**N / A**	**$28.07M**	**$28.07M**

N/A – Not applicable at this stage of the AMI Program

Reporting Metric Notes:

A. Network Installation

Estimated Quantity of Work: 159 new poles and three radio gateways, 53 single-radio network gateways and 2207 routers have been installed to support the expansion of the existing RF Network

B. Percentage of Network Communicating to L+G Platform

Estimated Quantity of Work: Network installation has completed.

C. Actual Reads Recorded from AMI Meters

Actual read number is inclusive of large commercial AMI meters installed prior to start of current AMI Project.

D. Meter Reading Staff

Meter reading staffing fluctuates for various reasons. Permanent Meter Readers continue to decline month over month via natural attrition. Additional temporary Meter Reading staff have been hired to support Collection activities and vacations.

E. Number of customers receiving energy saving messages

Reports issued on September 1, 2021 and March 1, 2022 reported data based on all PSE&G electric customers who had received energy saving messages. In this report and subsequent reports, this metric will indicate how many PSE&G electric customers with AMI meters have received messages based on the implementation of use cases 1, 2, 3, 4, 5 and 7. Use cases not yet implemented.

F. Customers who have authorized third party supplier access to their energy usage data

The development of a Data Access Plan has been deferred pending the statewide proceeding in Docket No. EO20110716. PSE&G is participating in that Board Staff proceeding.

G. Third Party Customer Engagement Efforts

PSE&G has utilized social media outlets for third party customer engagement efforts to date. The activities and results are as follows:

1. Published 4 messages:

a) *4 organic messages on Facebook, Twitter and LinkedIn:*
   (1) 2 on Facebook,
   (2) 2 on Twitter,
      (a) 1 on PSEGDelivers,
      (b) 1 on PSEGNews.

2. Channel followers (as of June 2022):

a) *Facebook: 118,384*
b) *PSEGDelivers (Twitter): 102,165*
c) *PSEGNews (Twitter): 20,860*

3. The social media posts generated:

a) *16,224 impressions (how many times an AMI social message was displayed),*
b) *Reached 14,009 Facebook users*

H. Remote Connects/Disconnects Performed

Use case not yet implemented. A. AMI Metering Tampering Cases

Use case not yet implemented.

I. AMI Metering Tampering Cases

Use case not yet implemented.

J. Correction issued for Meters Installed.

The '**Project to date 1/7/2021 to 6/30/2022**' data figures for line items related to 'residential meters installed' and 'commercial meters installed' was corrected to read as 129,738 and 34,661 meters respectively.
